

ASTR 620: Planetary Processes
Professor Eric Nielsen

Lecture 17: Atmospheres

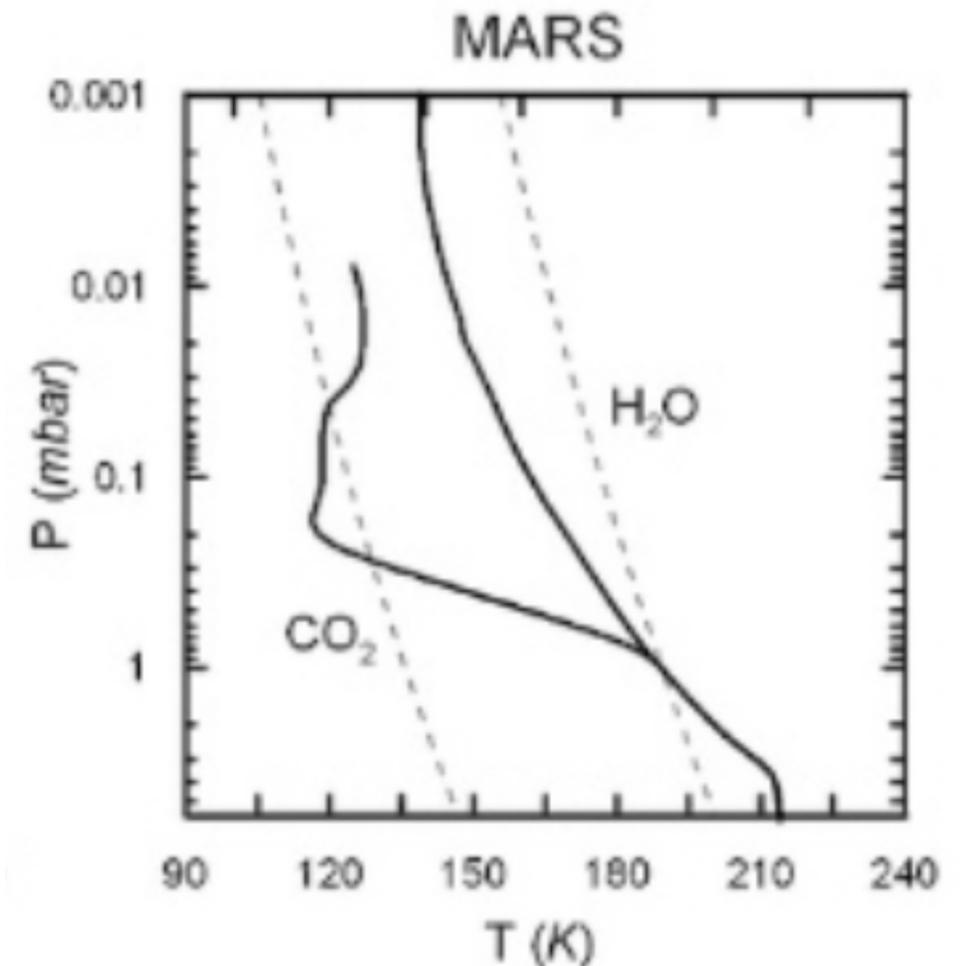

Logistics

- Masks are encouraged
- No laptops, phones, or other electronic devices during class (I'll let you know in advance if we'll need laptops for an activity) **You may use a tablet to take notes if prefer, but please only use it for note-taking.**
- Remember to bring you response card to class
- Homework 4 due tonight at 11:59pm

Review of the last class

- On a given day on Mars, the temperature-pressure profile follows the solid line on the left. On that day, carbon dioxide clouds:
 - (A) — Can form at altitudes below 0.8 bars or altitudes above 0.06 bars
 - (B) — Can form at altitudes between 0.06 and 0.8 bars
 - (C) — Can form anywhere at altitudes below 0.8 bars
 - (D) — Can form anywhere at altitudes above 0.06 bars
 - (E) — Cannot form at all

Review of the last class

- Zonal, meridional, and vertical winds travel:
 - (A) — North/South, East/West, and Up/Down
 - (B) — North/South, Up/Down, and East/West
 - (C) — East/West, North/South, and Up/Down
 - (D) — East/West, Up/Down, and North/South
 - (E) — Up/Down, East/West, and North/South

Review of the last class

- Earth's atmosphere is in:
 - (A) — Geostrophic balance, so winds flow parallel to isobars
 - (B) — Geostrophic balance, so winds flow perpendicular to isobars
 - (C) — Cyclostrophic balance, so winds flow parallel to isobars
 - (D) — Cyclostrophic balance, so winds flow perpendicular to isobars
 - (E) — Earth does not have an atmosphere

Review of the last class

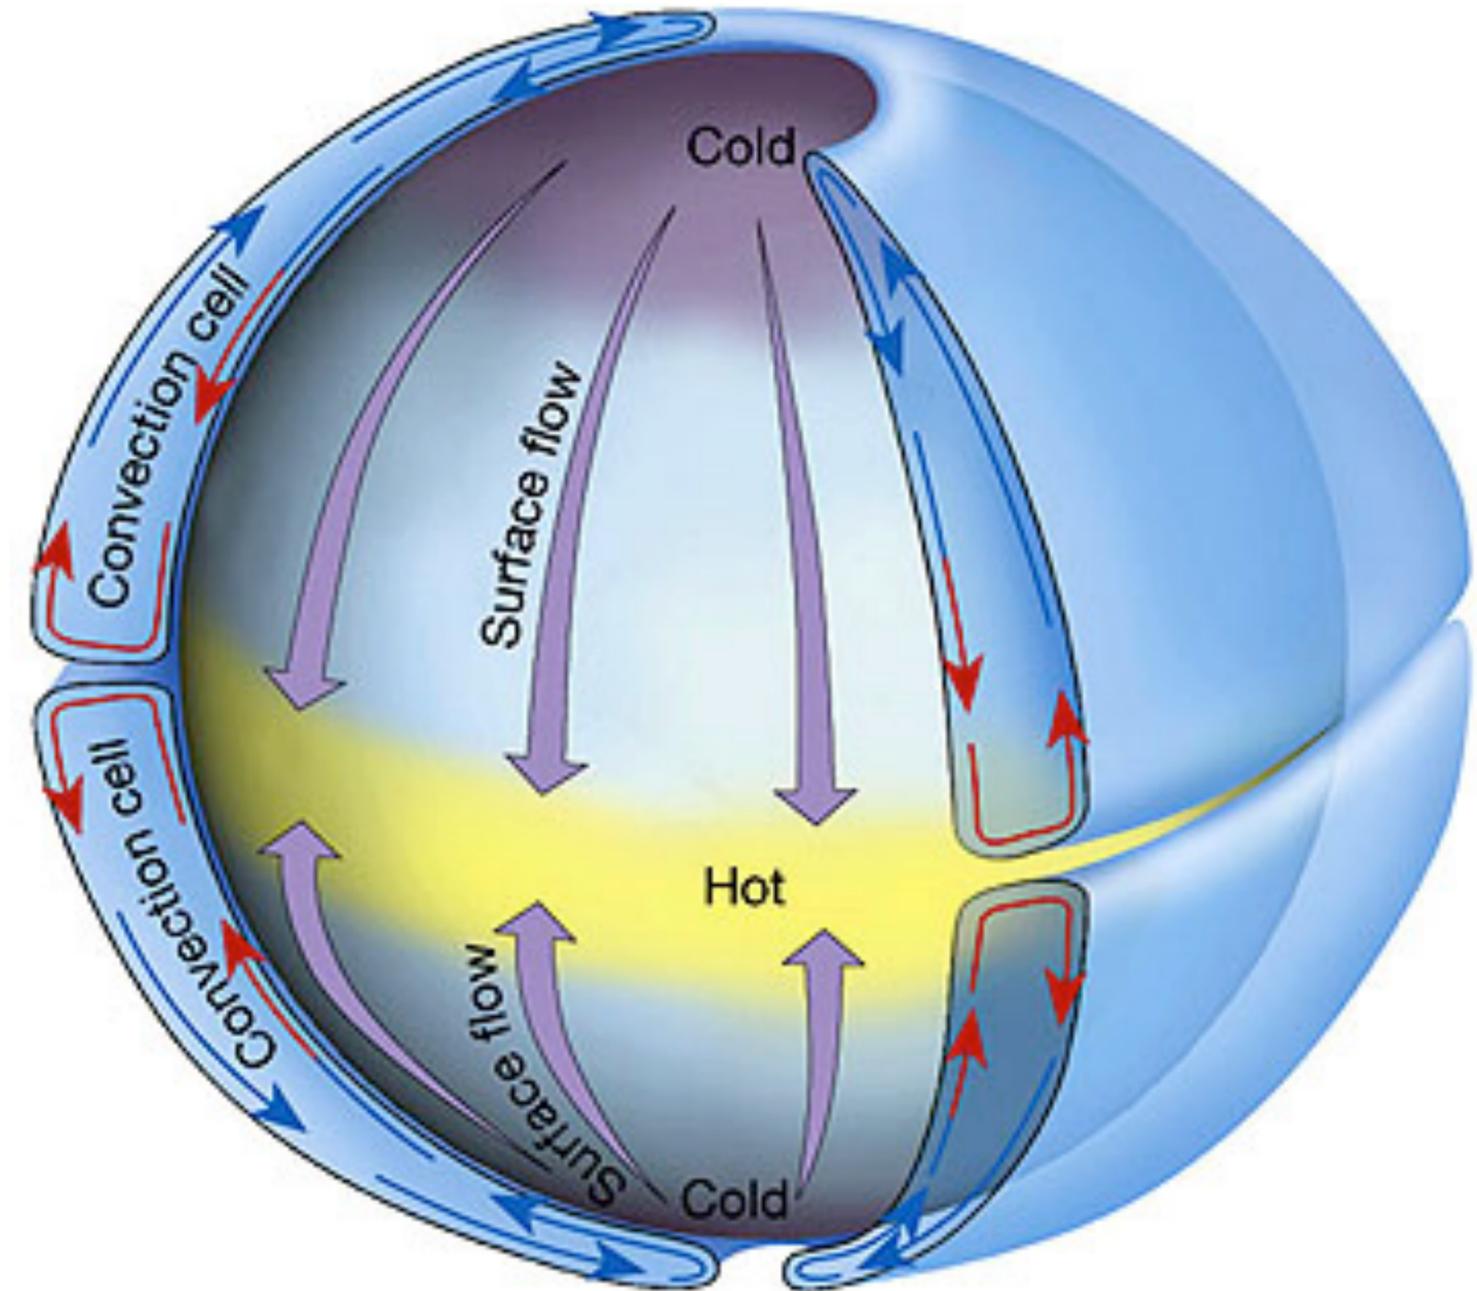

- In geostrophic balance:
 - (A) — The pressure gradient balances the centrifugal force
 - (B) — The pressure gradient balances the Coriolis force
 - (C) — The centrifugal force balances gravity
 - (D) — The centrifugal force balances the Coriolis force
 - (E) — The pressure gradient balances gravity

Review of the last class

- Earth's atmosphere is in geostrophic balance while Venus' is not because:
 - (A) — Venus is much hotter than Earth
 - (B) — Earth has more water vapor in its atmosphere than Venus
 - (C) — Earth has a stronger magnetic field than Venus
 - (D) — Earth rotates faster than Venus
 - (E) — Both planets' atmospheres are in geostrophic balance

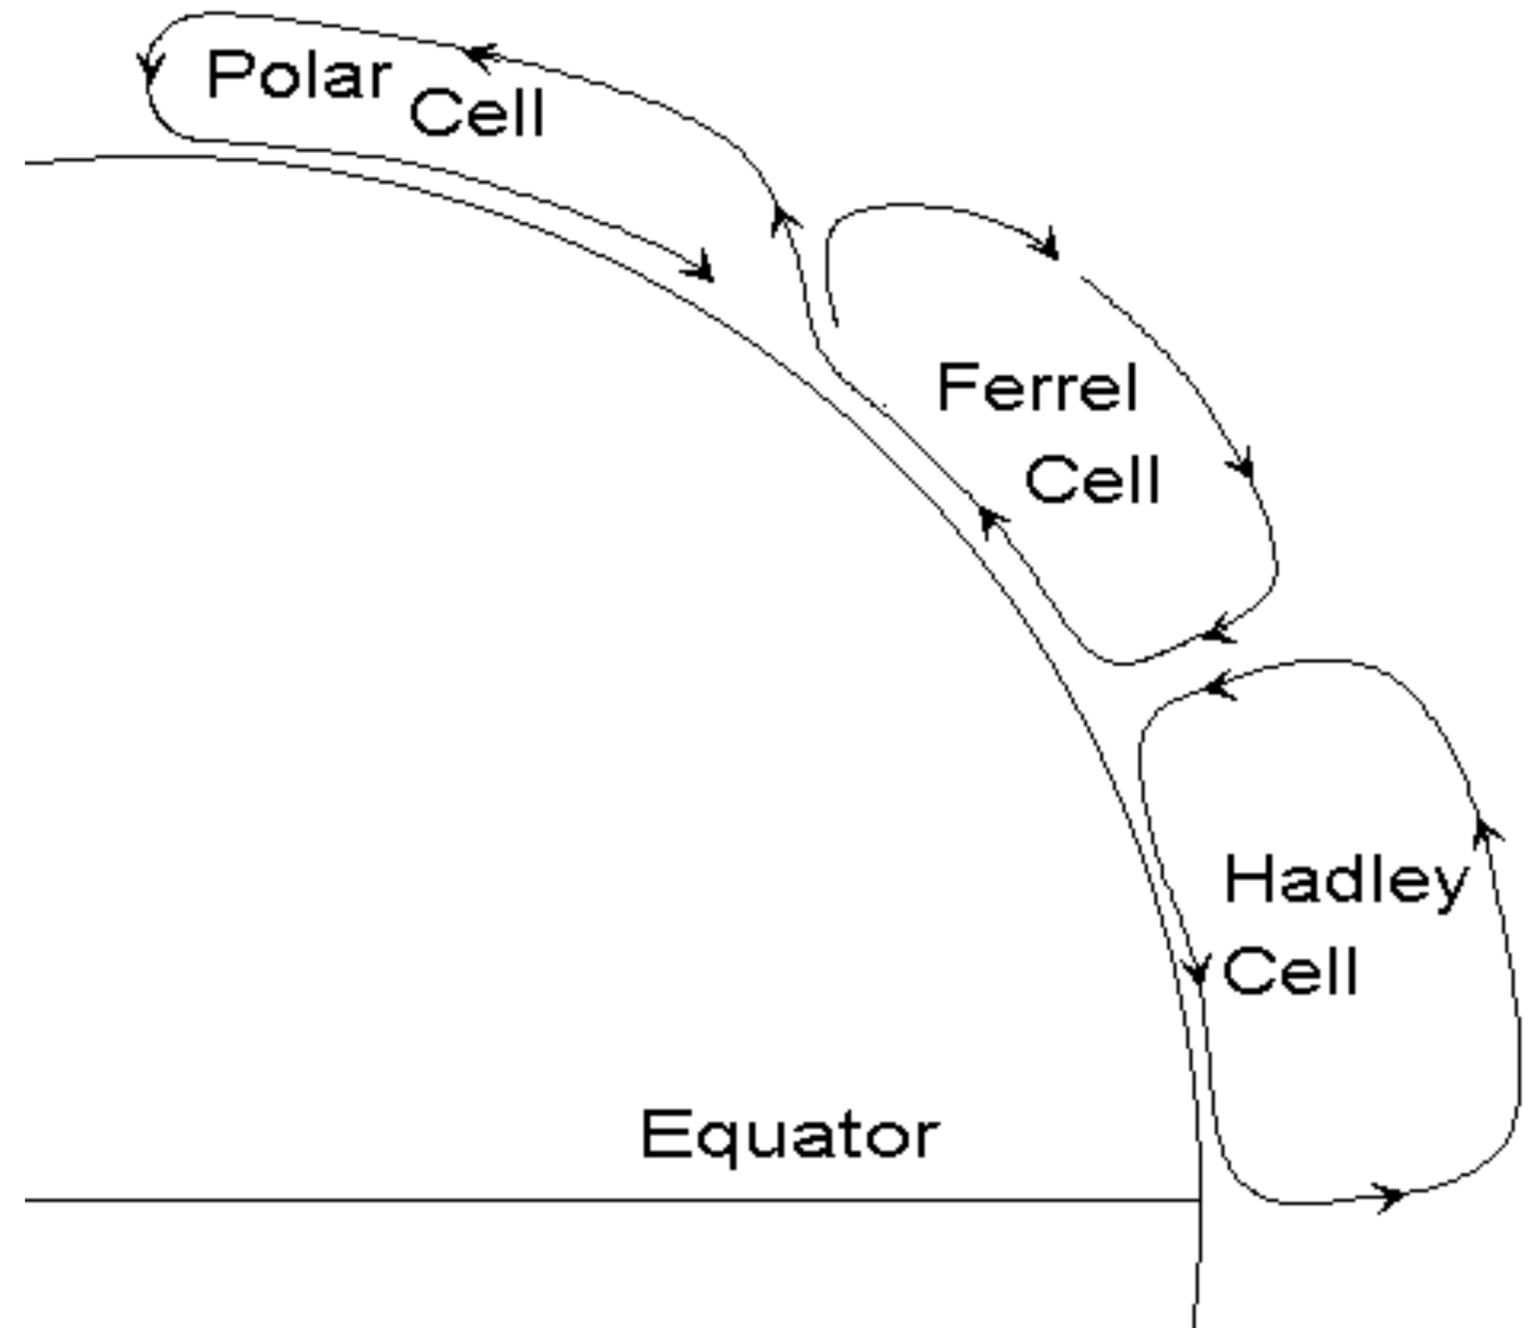

Hadley Circulation

- For no/slow rotation

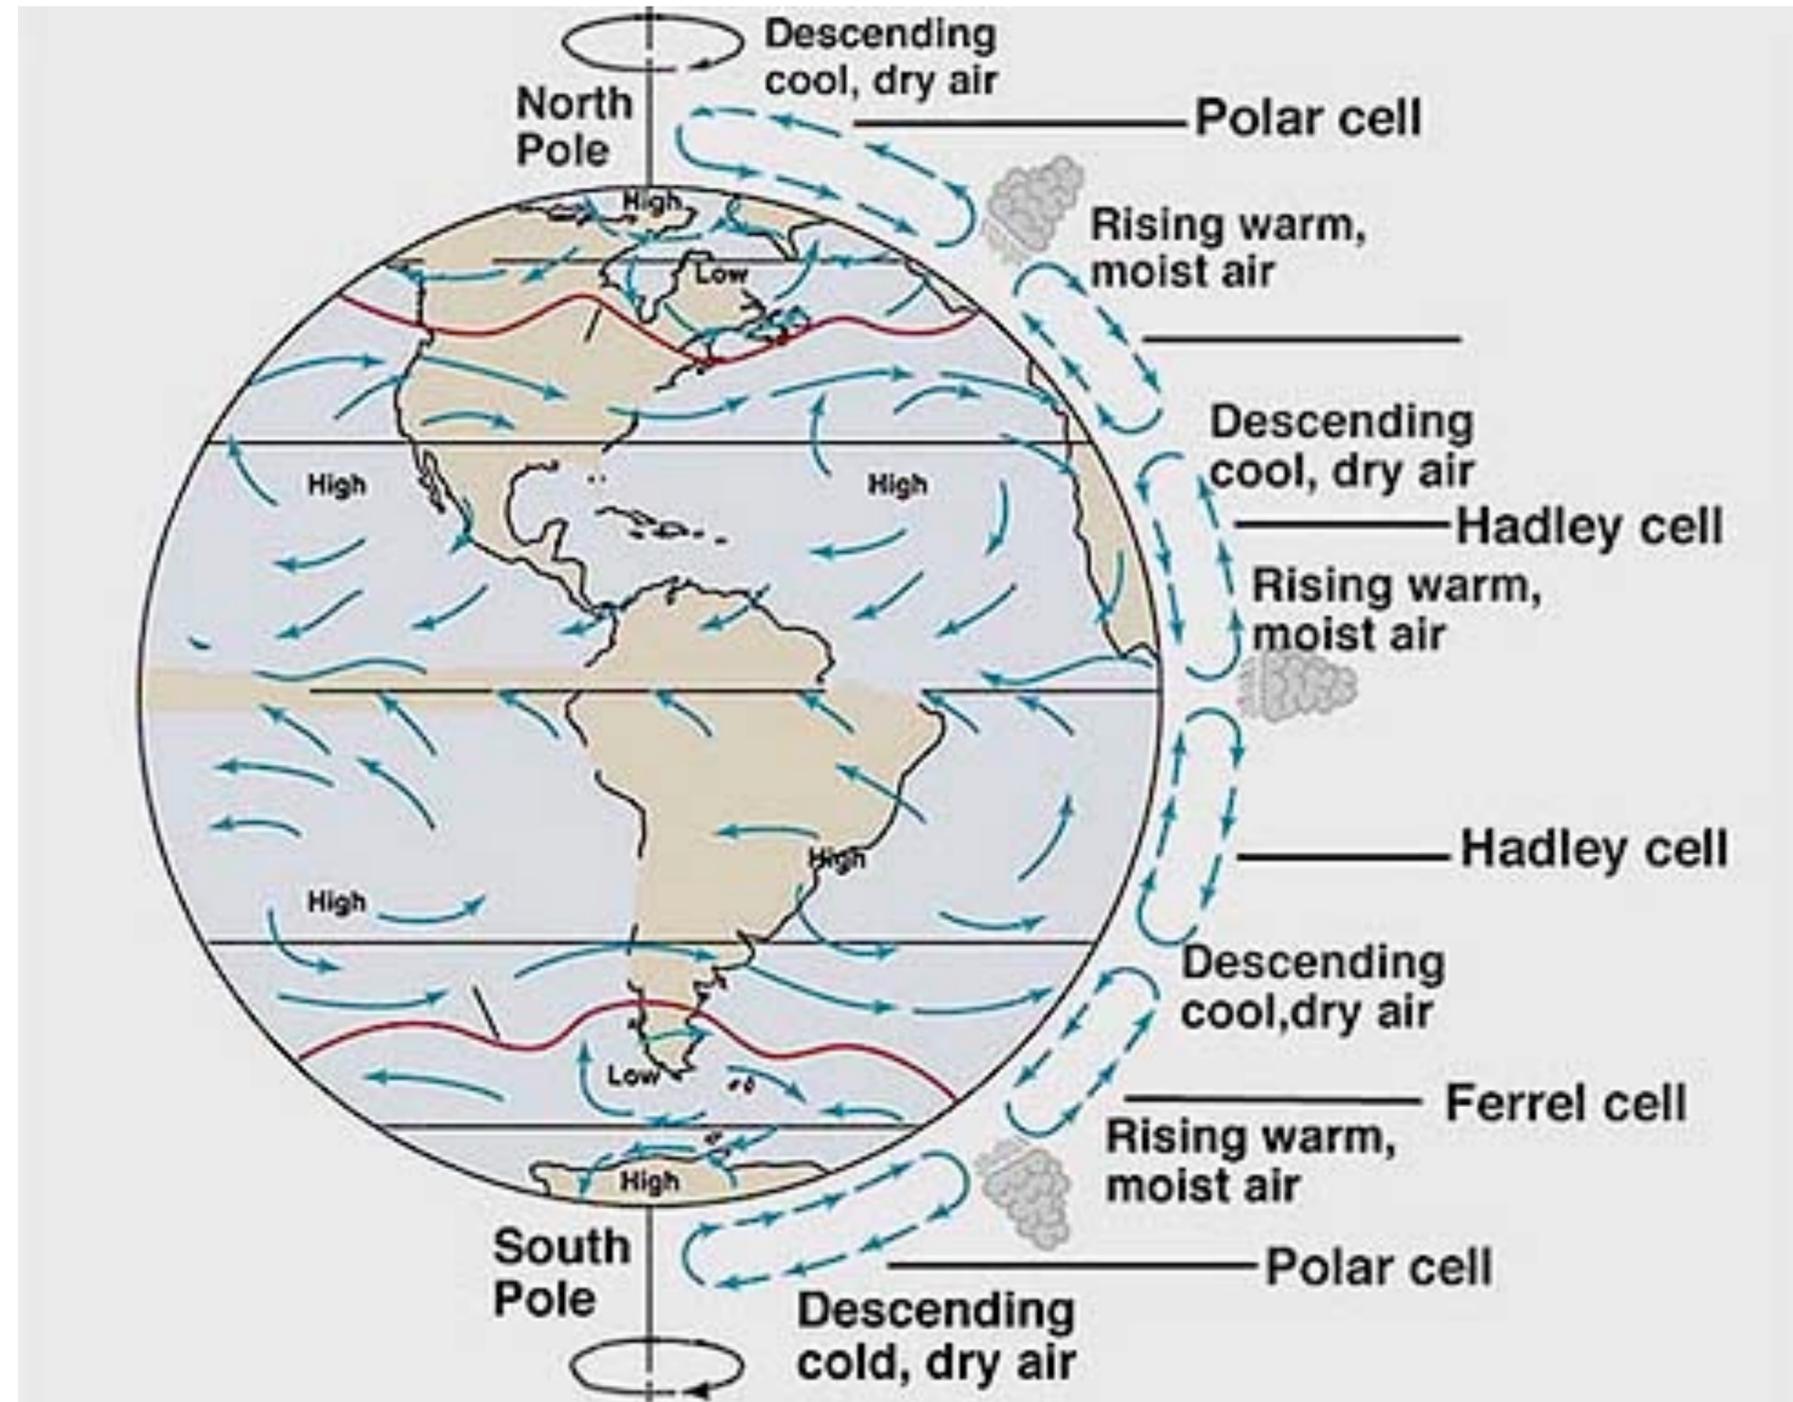

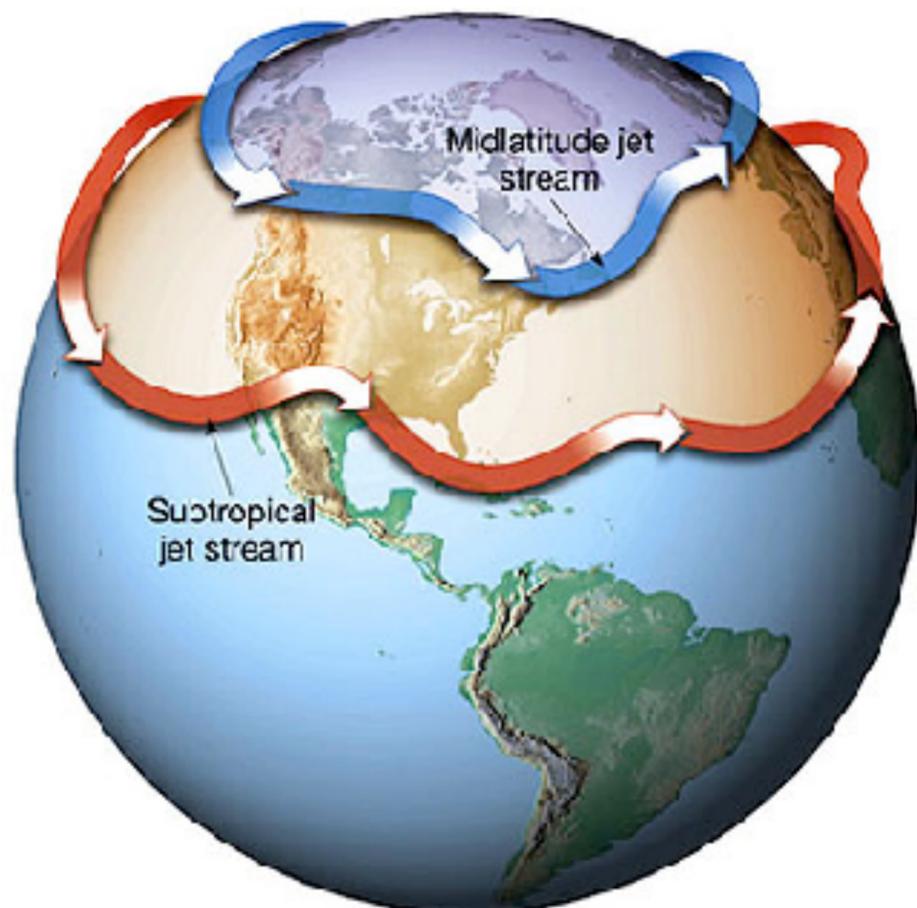

Hadley Circulation

- For faster rotation (like on Earth), have interaction of different amounts of sunlight (“insolation”) and Coriolis force as a function of latitude
- Get 3 convective cells per hemisphere:
 - Hadley cells
 - Polar cells
 - Ferrel cells

Hadley Circulation

- Cells meet at ~30 and ~60 degrees latitude
 - (locations of the tropical and polar jet streams)

Hadley cell (thermal direct)

Air rises near equator and descends near 30° where a belt of high pressure is found (subtropical high)

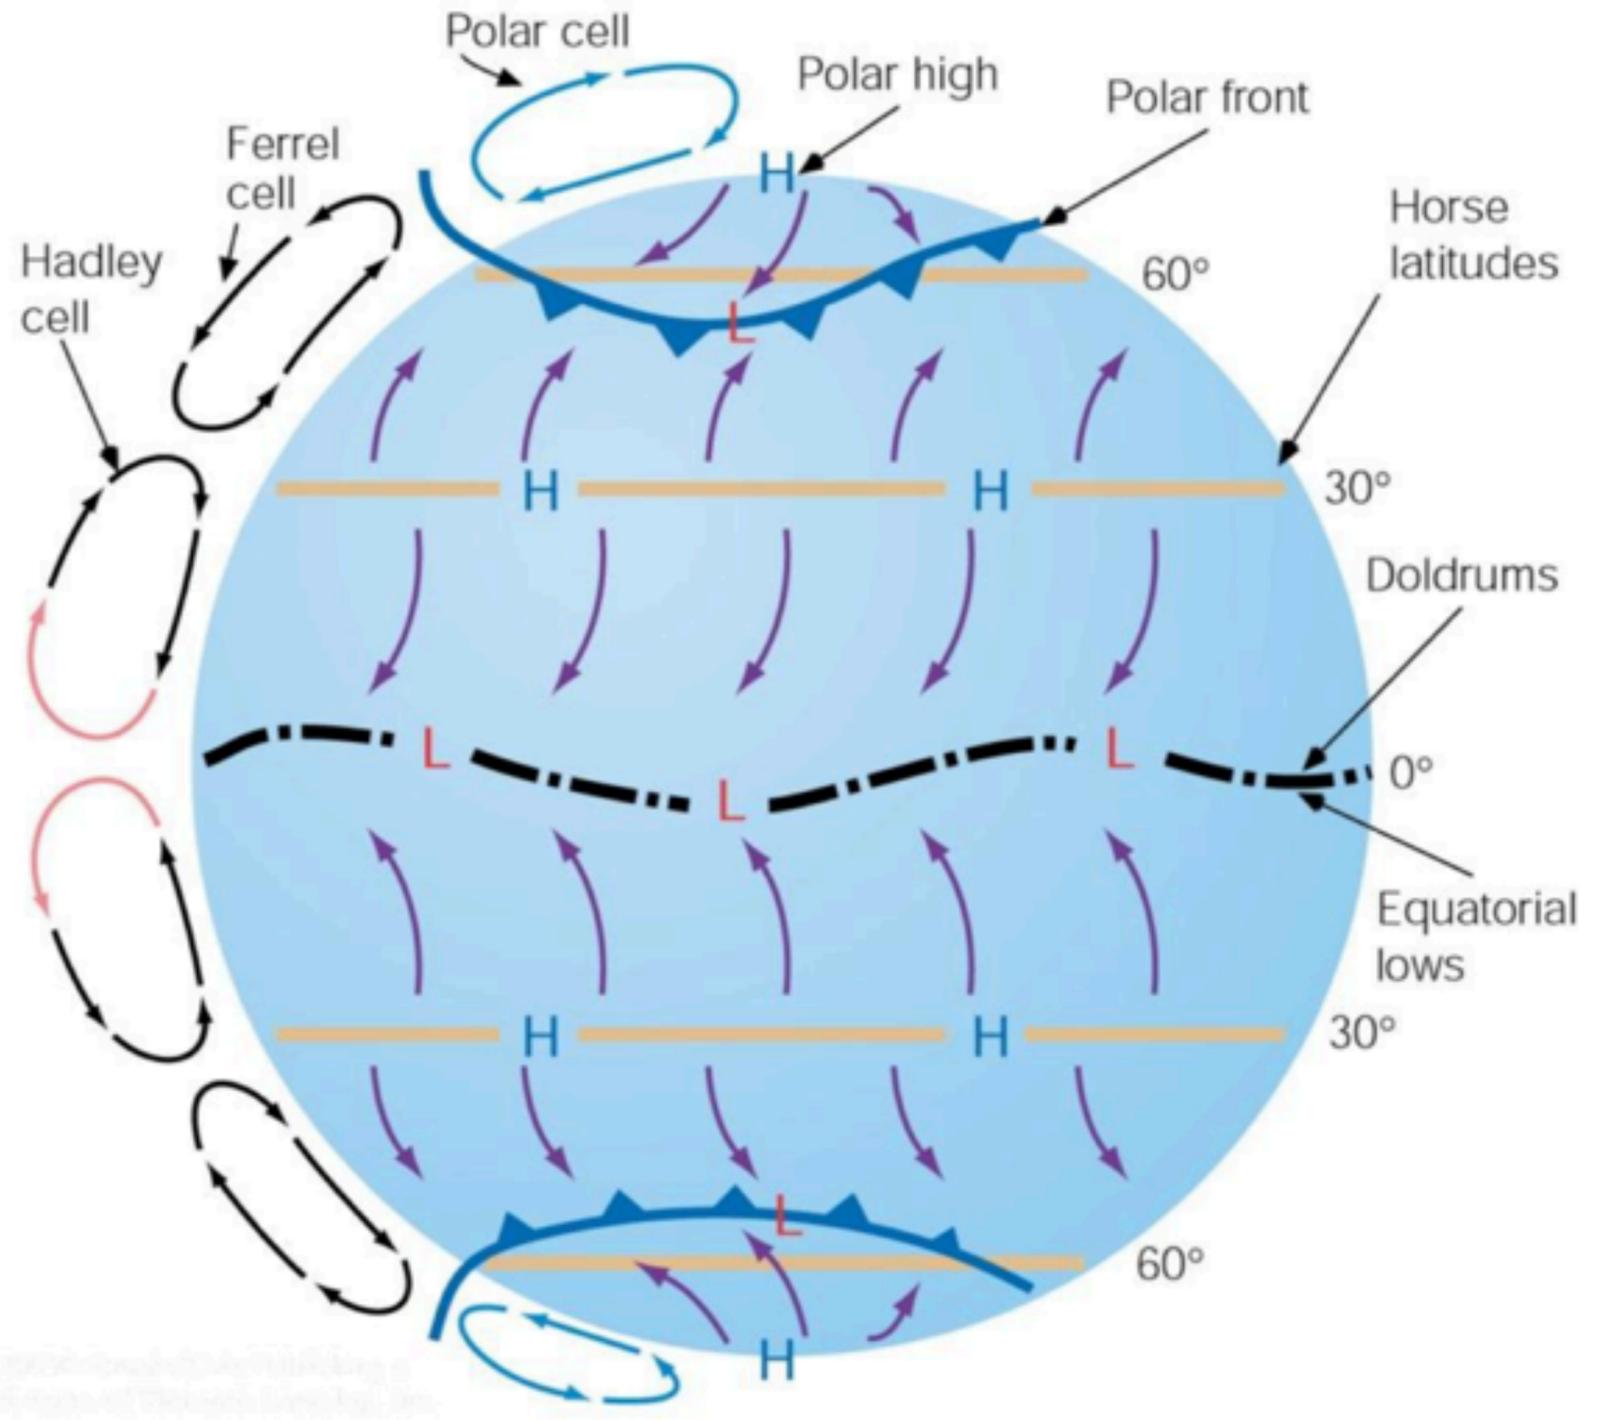

Polar Cell (thermal direct)

Cold air moving southward from the pole rises when it reaches the **polar front** near 60°. The rising air aloft returns to the north where it sinks back to the pole.

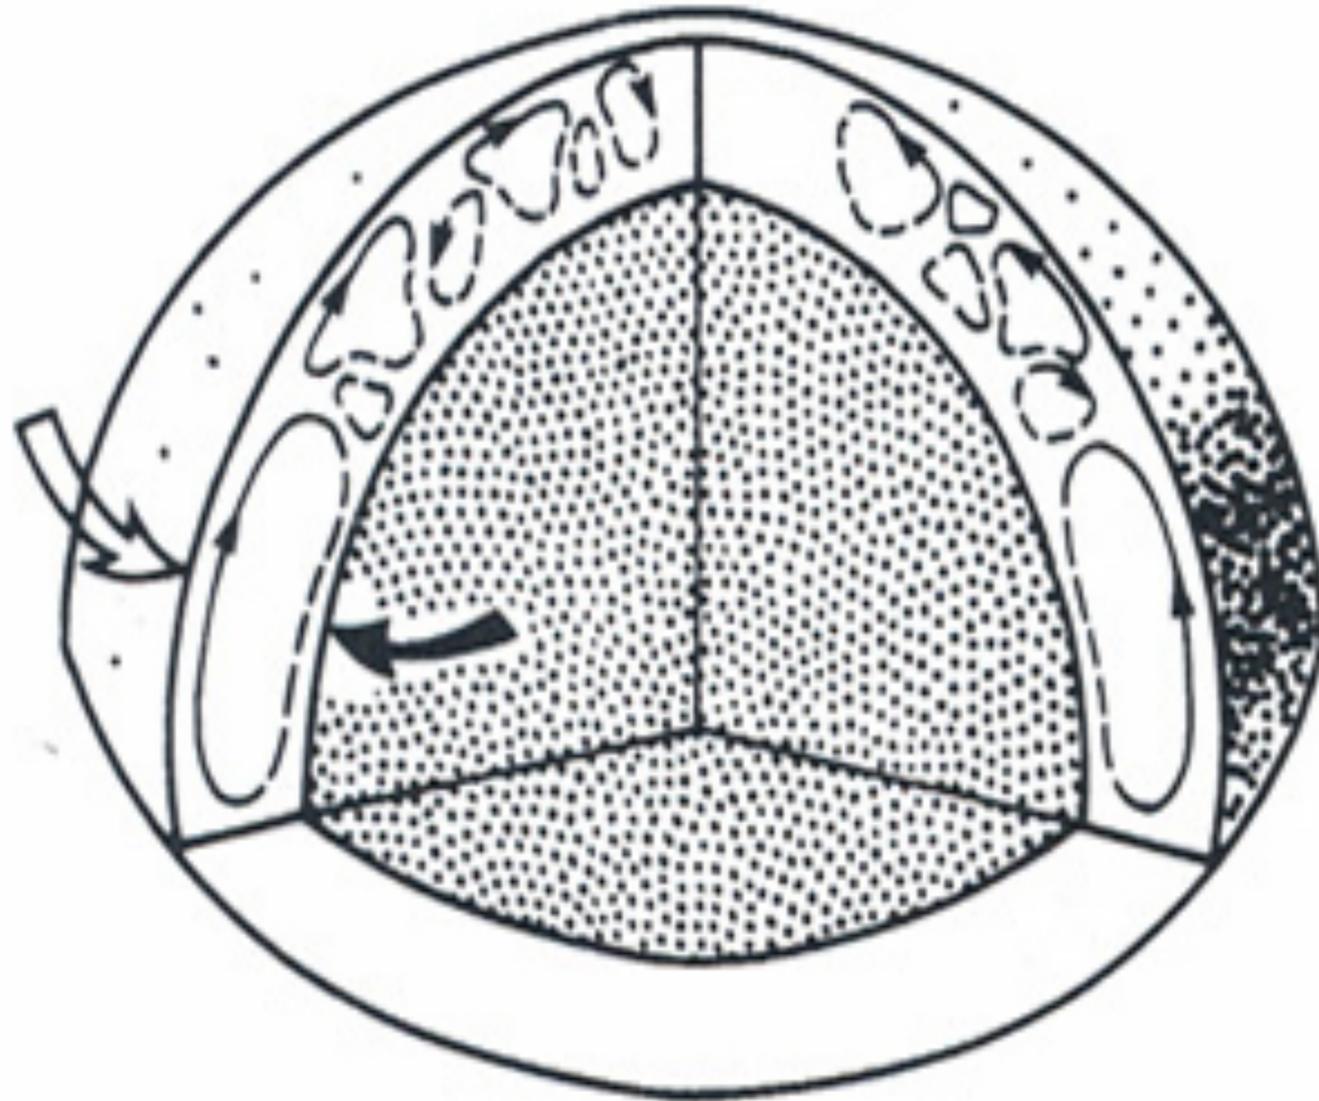

Ferrel Cell (thermal indirect)

A reverse circulation between the Hadley and Polar Cell (between 30° and 60°) that carries air northward near the surface and southward aloft

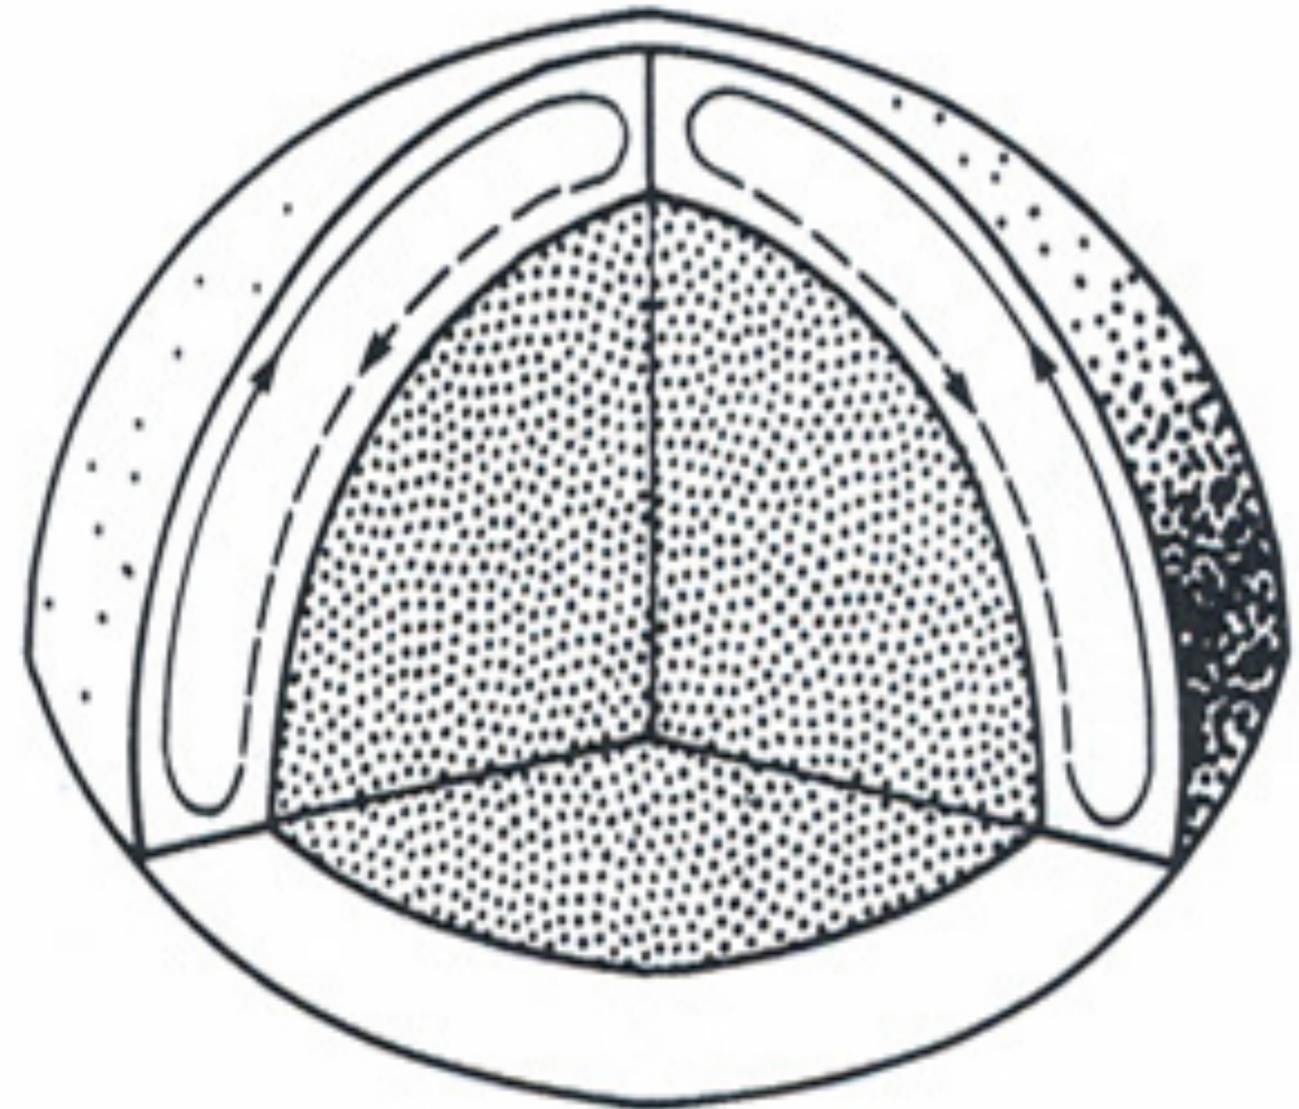

A rotating earth break the single cell into Three Cells

Earth and Venus

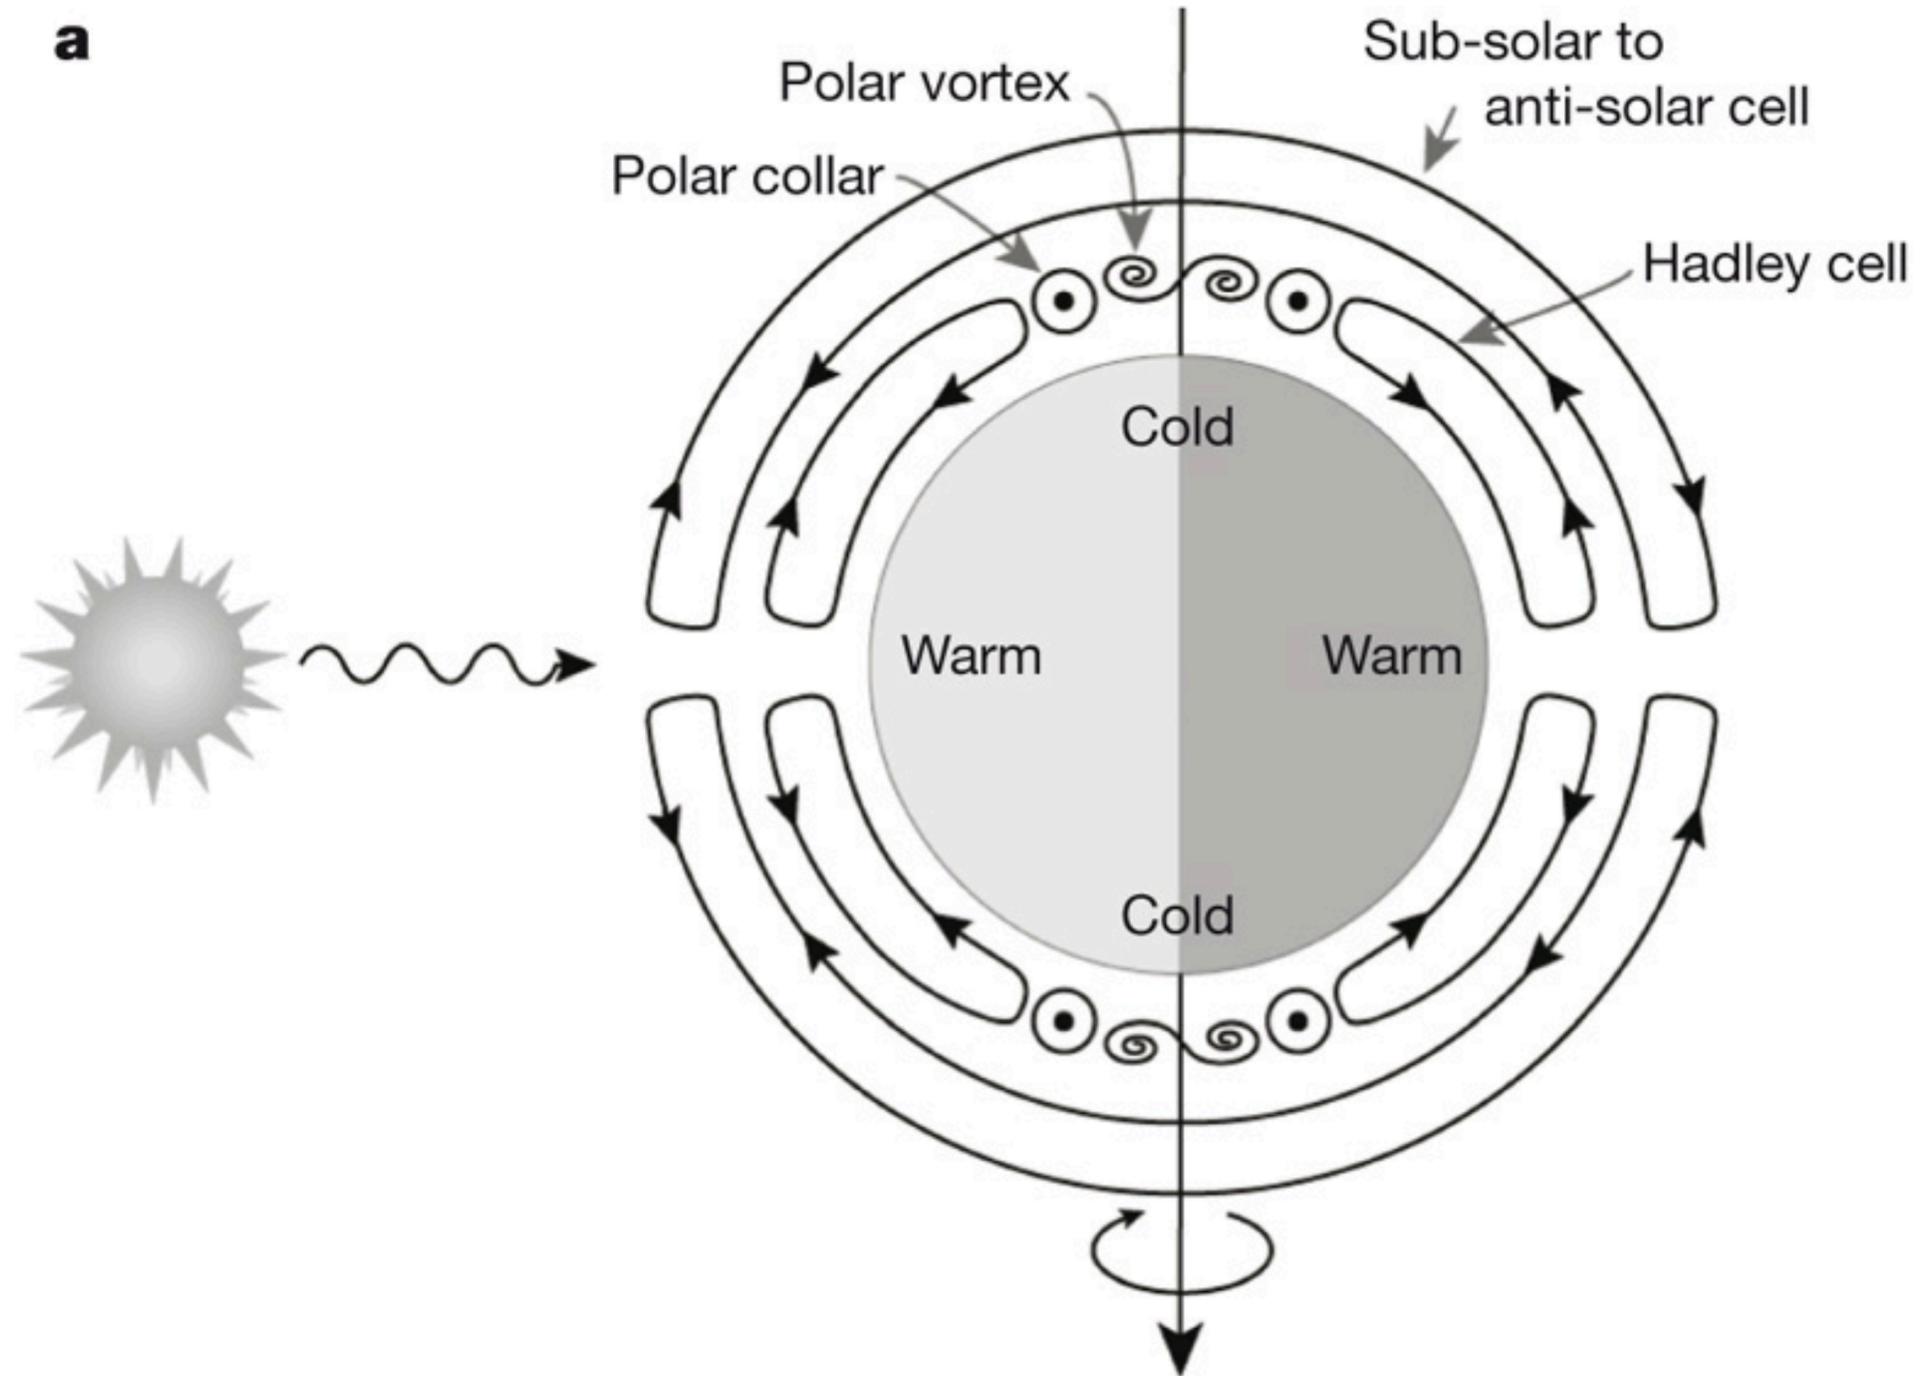

a) EARTH

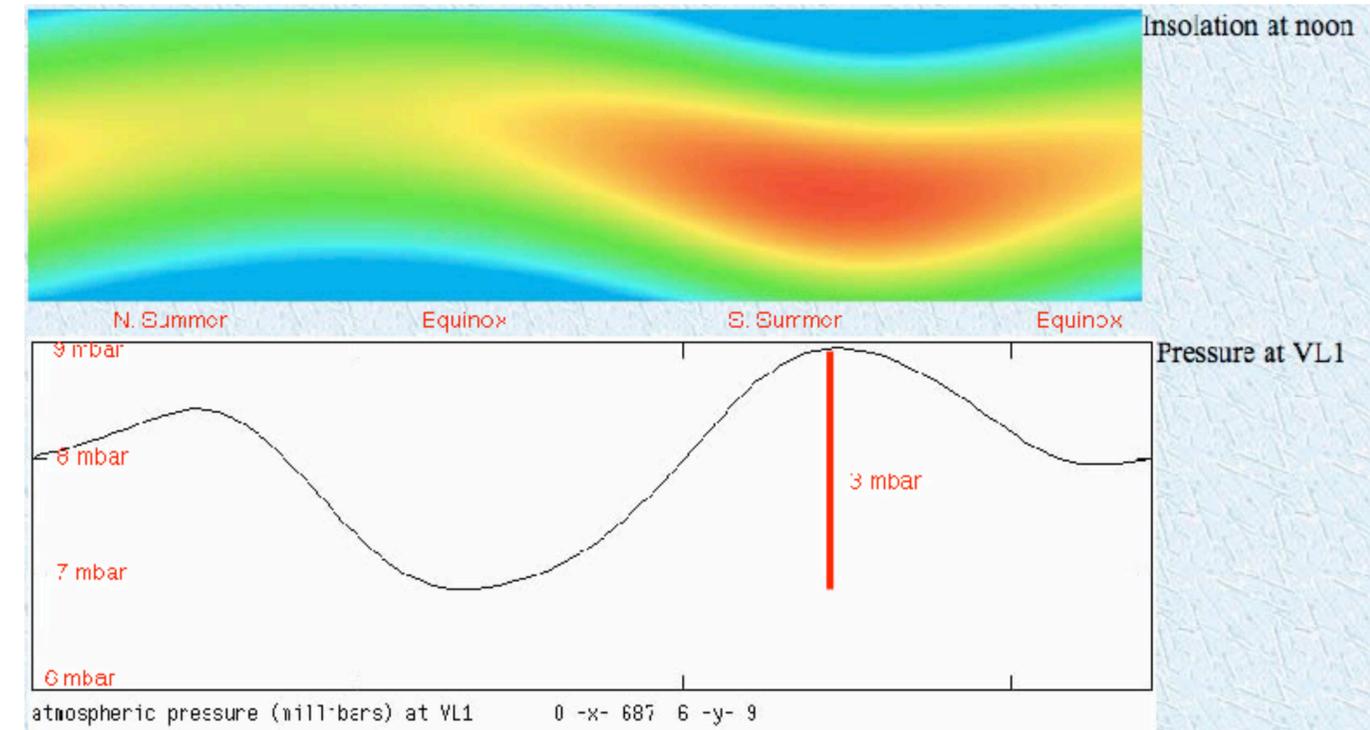

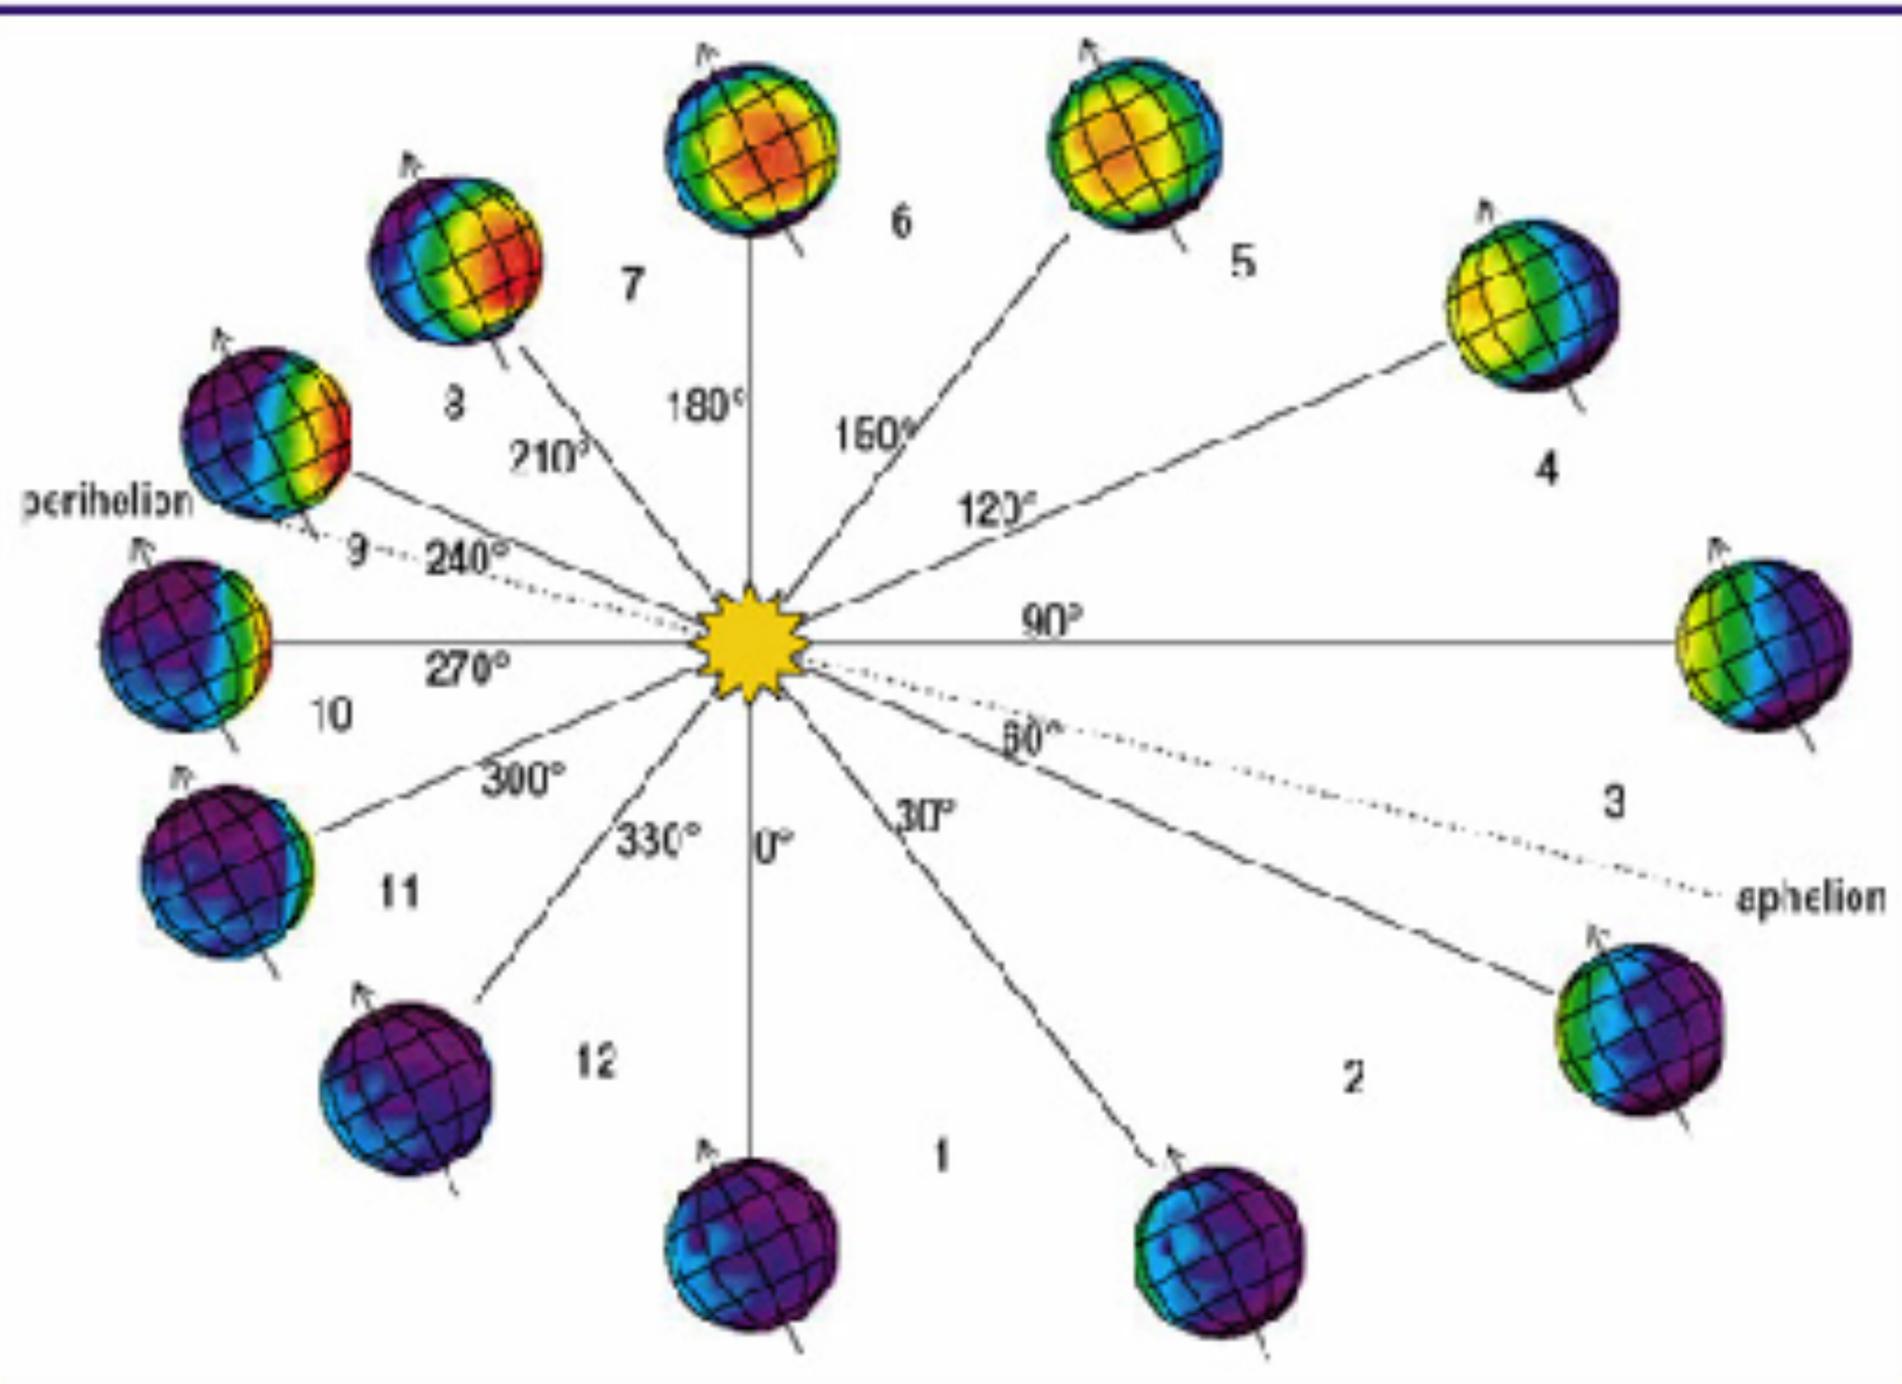

b) VENUS

Venus

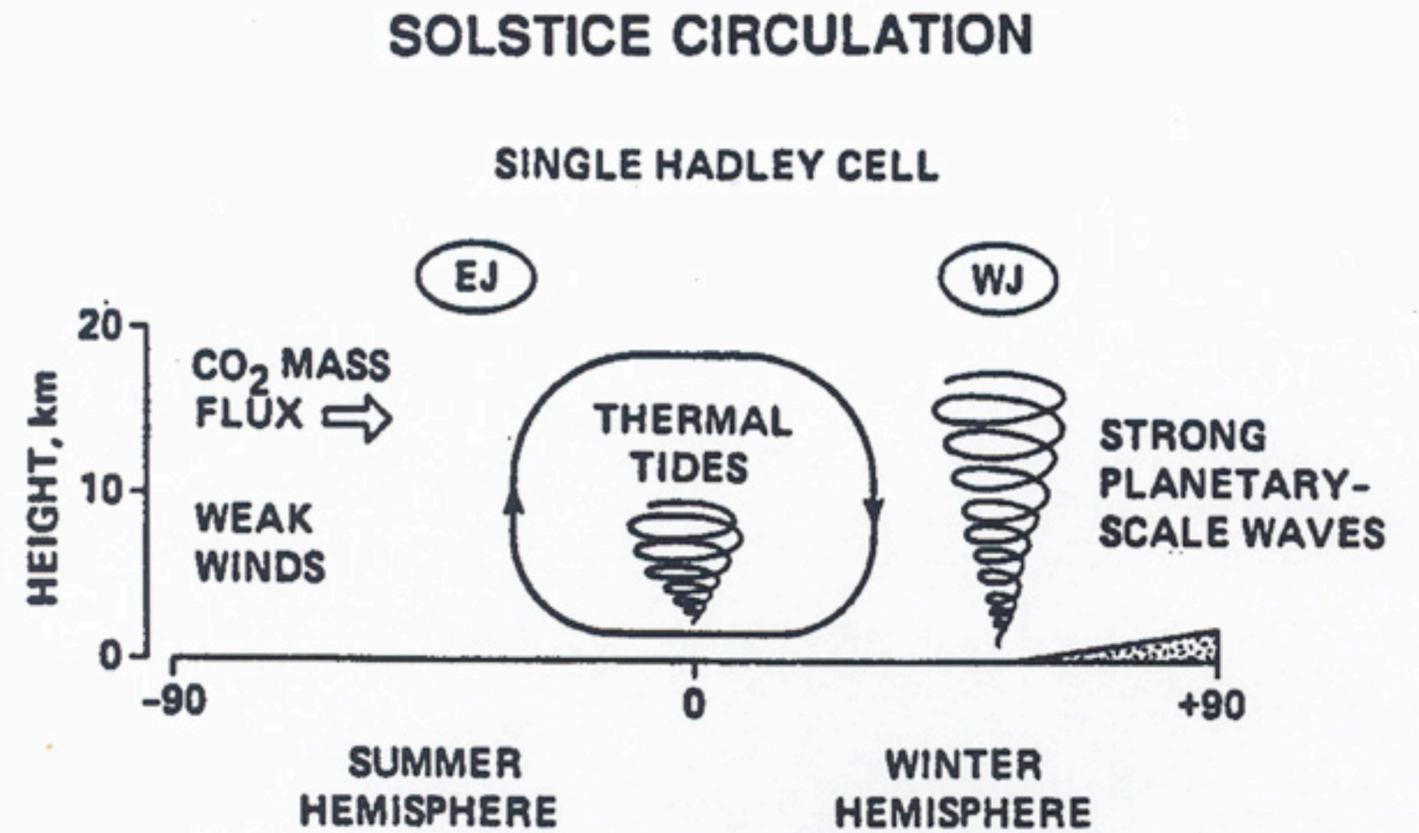

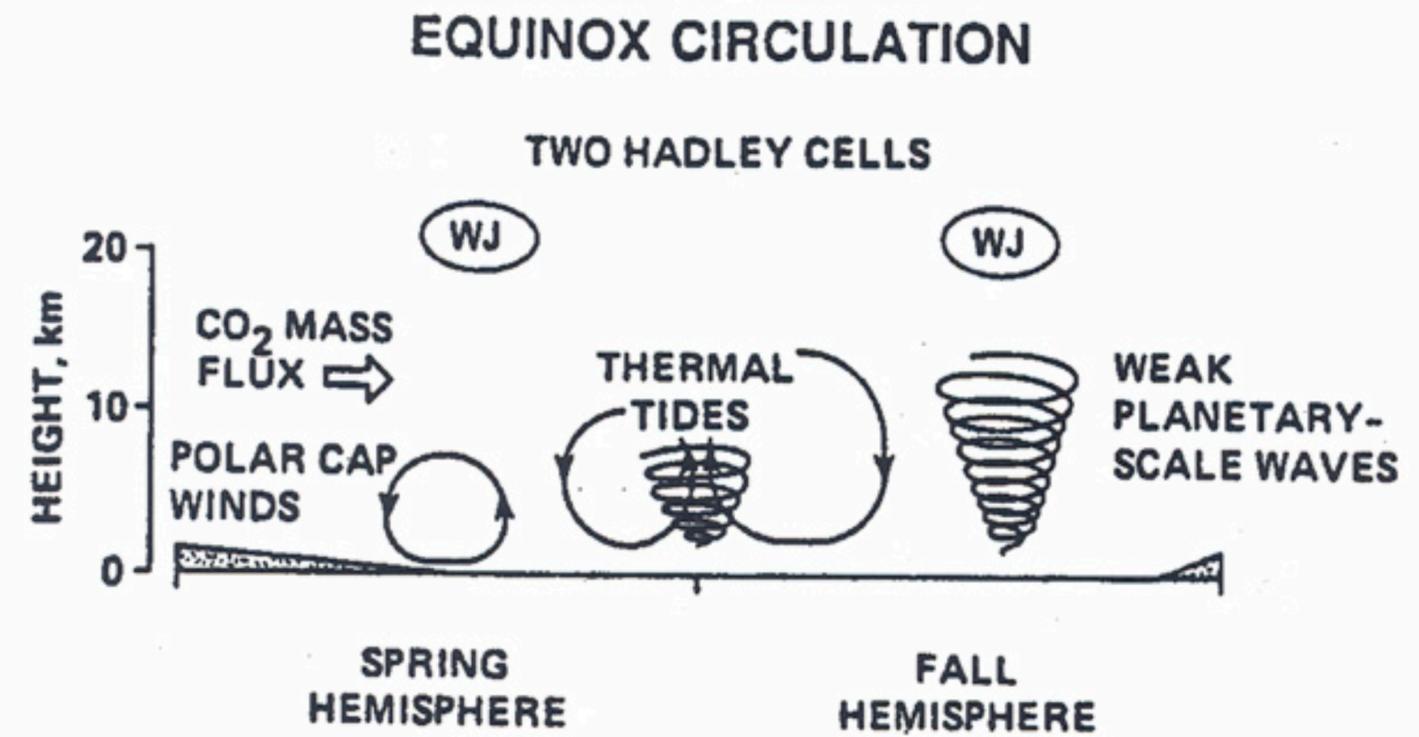

Mars

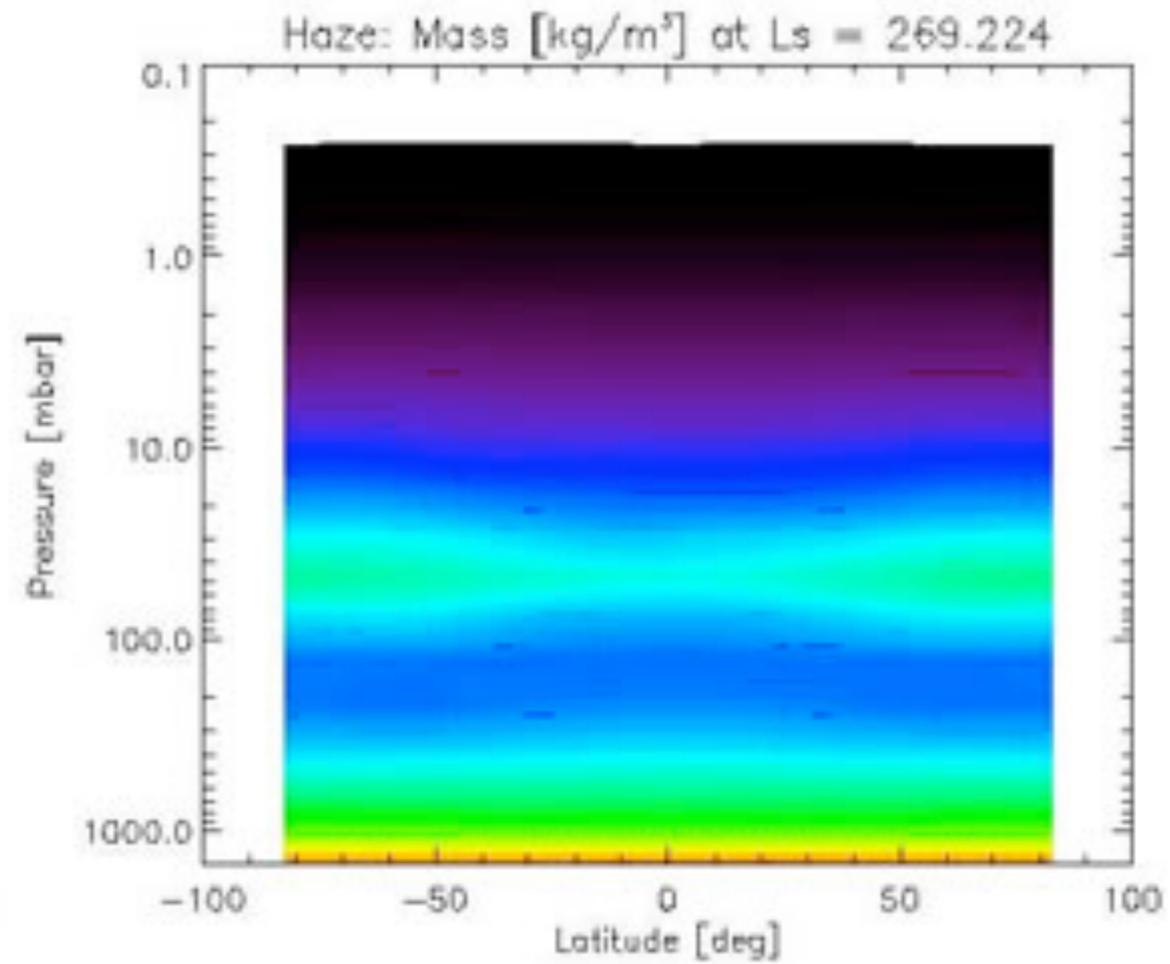

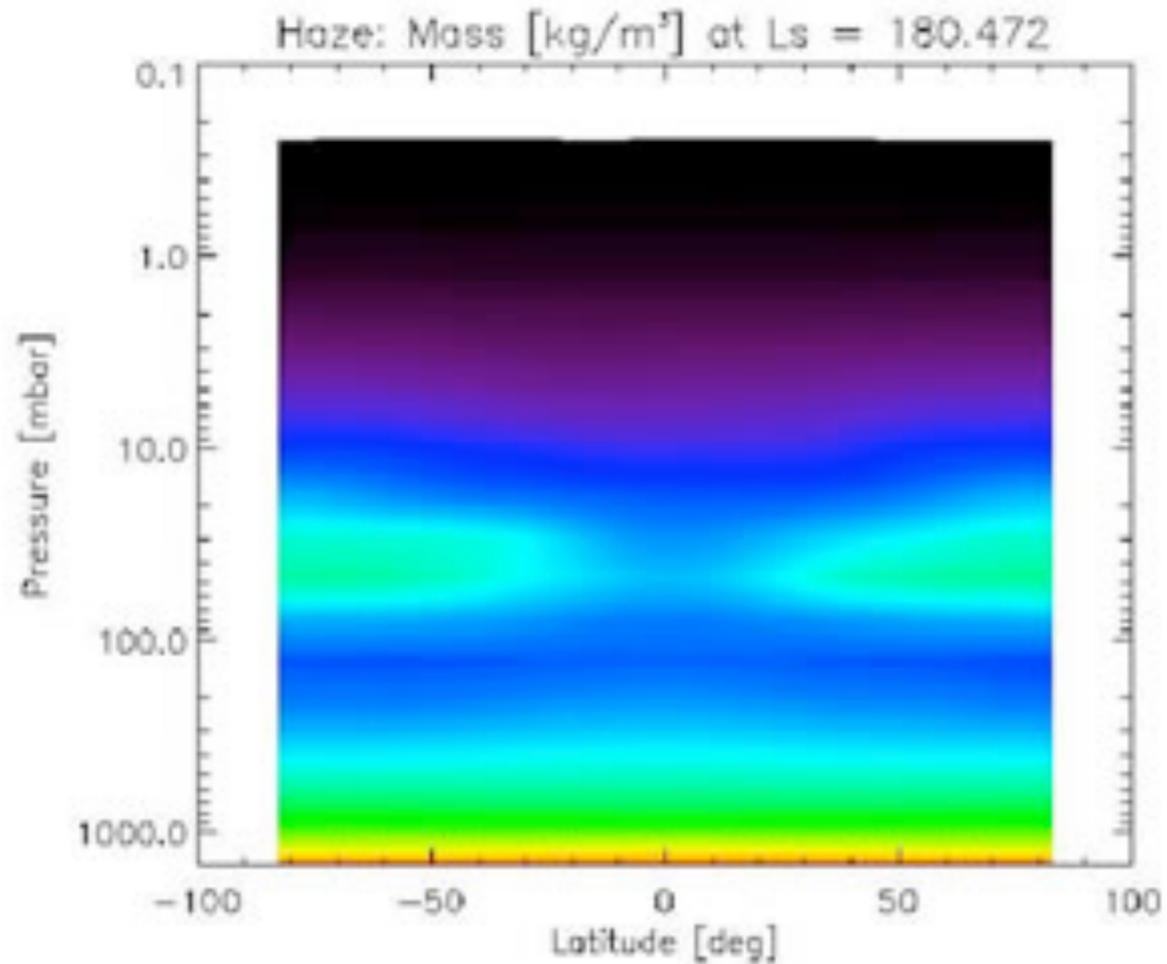

- Seasonal changes very important
- $e=0.0934$, obliquity = 25.2 degrees
 - (For Earth, $e=0.017$, obliquity = 23.5)

Mars

Titan

- Start of northern fall (equinox)
- Equator-to-pole Hadley circulation results in accumulation of haze at poles

Northern Winter

pole-to-pole circulation

Break

05:00

Atmospheric Waves

- Role of waves in atmospheric dynamics:
 - Modify mean atmospheric structure (temperature, composition)
 - Alter mean atmospheric flow (e.g. accelerate it)
- Waves are characterized by amplitude, wavelength, and frequency (and also phase speed, group speed when propagating)

Atmospheric Waves

- Classified in various ways:
 - restoring mechanism (e.g. gravity, Coriolis force)
 - forced vs. free modes (e.g. thermal tides)
 - traveling vs. stationary (trapped by topography?)

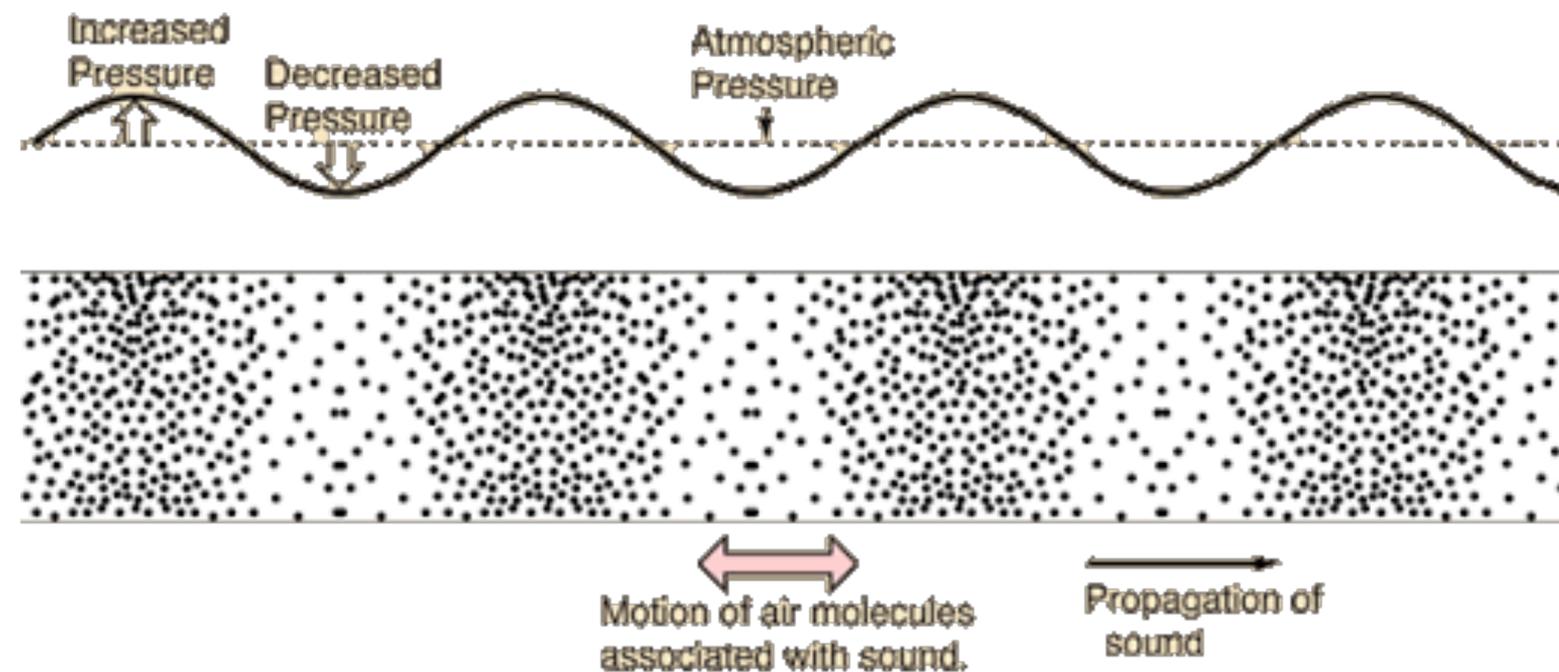

Perturbation Theory

- $u(x, t) = \bar{u} + u'(x, t)$
 - 1) Determine which terms in motion and thermodynamic equations are relevant for particular types of wave
 - 2) Use perturbation theory to make magnitudes linear
 - 3) Derive wave equations for appropriate for field variable
 - 4) Introduce harmonic solution containing amplitudes, wavenumbers, frequency (oversimplification: really need Fourier series)
 - 5) Derive dispersion relation (phase speed vs. wavenumber) and group speed where appropriate

Acoustic Waves

- Result from restoration effect of gradient pressure force
- Oscillating pressure (compression, rarefaction) can be considered adiabatic
- Longitudinal waves (particle oscillation is parallel to propagation direction)

Acoustic Waves

- Relevant equations:

$$(v = w = 0)$$

- Momentum equation:

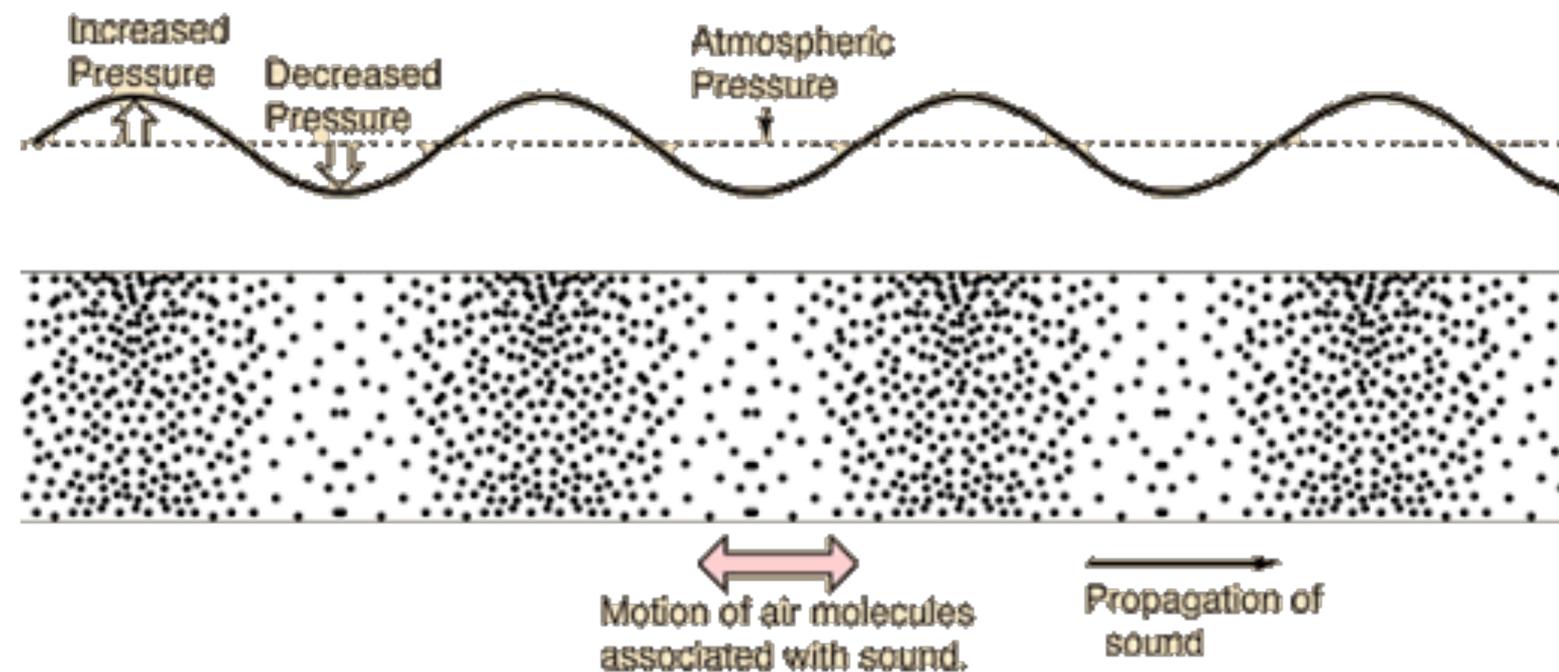

$$\frac{du}{dt} + \frac{1}{\rho} \frac{\partial P}{\partial x} = 0$$

- Continuity equation:

$$\frac{d\rho}{dt} + \rho \frac{\partial u}{\partial x} = 0$$

- Thermodynamics:

$$P\rho^{-\gamma} = \text{constant}$$

Acoustic Waves

- Use perturbation theory to expand variables:

$$u(x, t) = \bar{u} + u'(x, t)$$

$$P(x, t) = \bar{P} + P'(x, t)$$

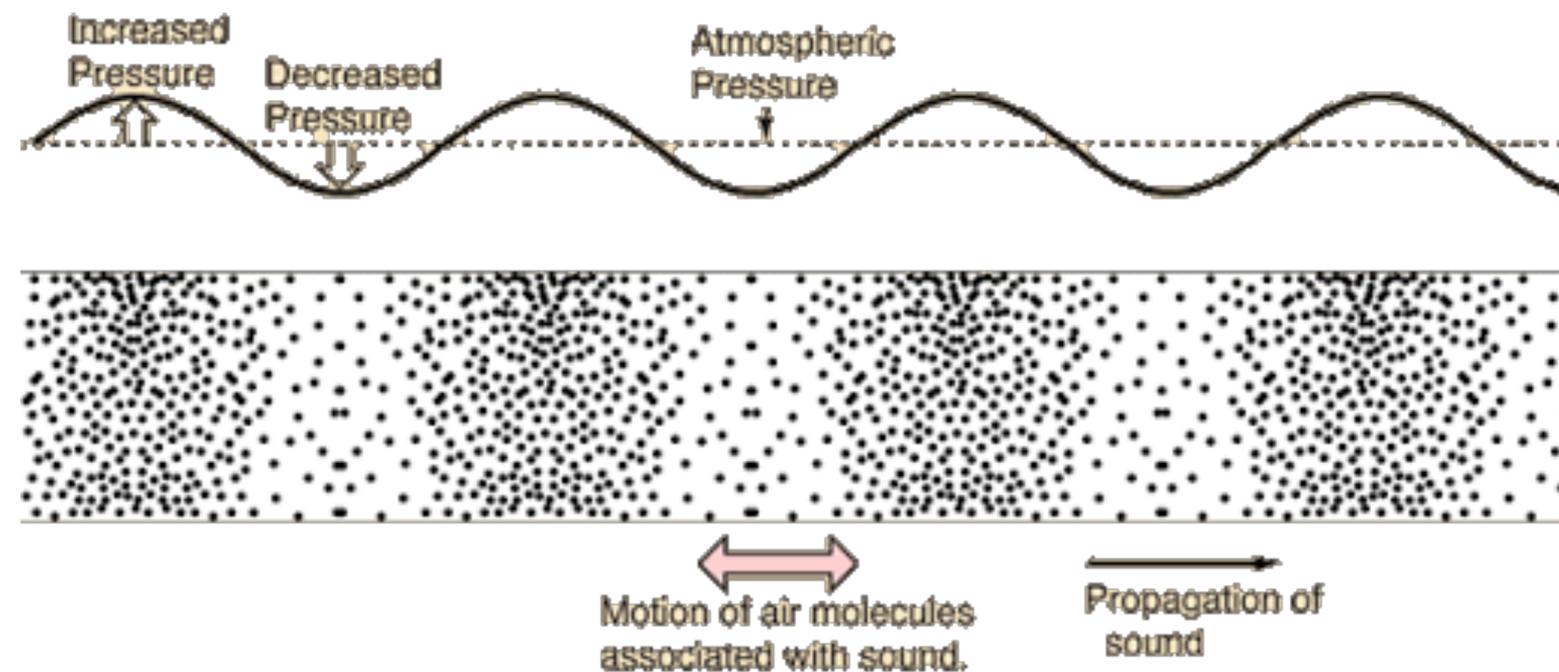

$$\rho(x, t) = \bar{\rho} + \rho'(x, t)$$

- After a bit of math, we get:

$$\left(\frac{\partial}{\partial t} + \bar{u} \frac{\partial}{\partial x} \right)^2 P' - \frac{\gamma \bar{P}}{\bar{\rho}} \frac{\partial^2 P'}{\partial x^2} = 0$$

- This has a solution of the form:

$$P' = P_0 e^{ik(x - c_w t)}$$

Acoustic Waves

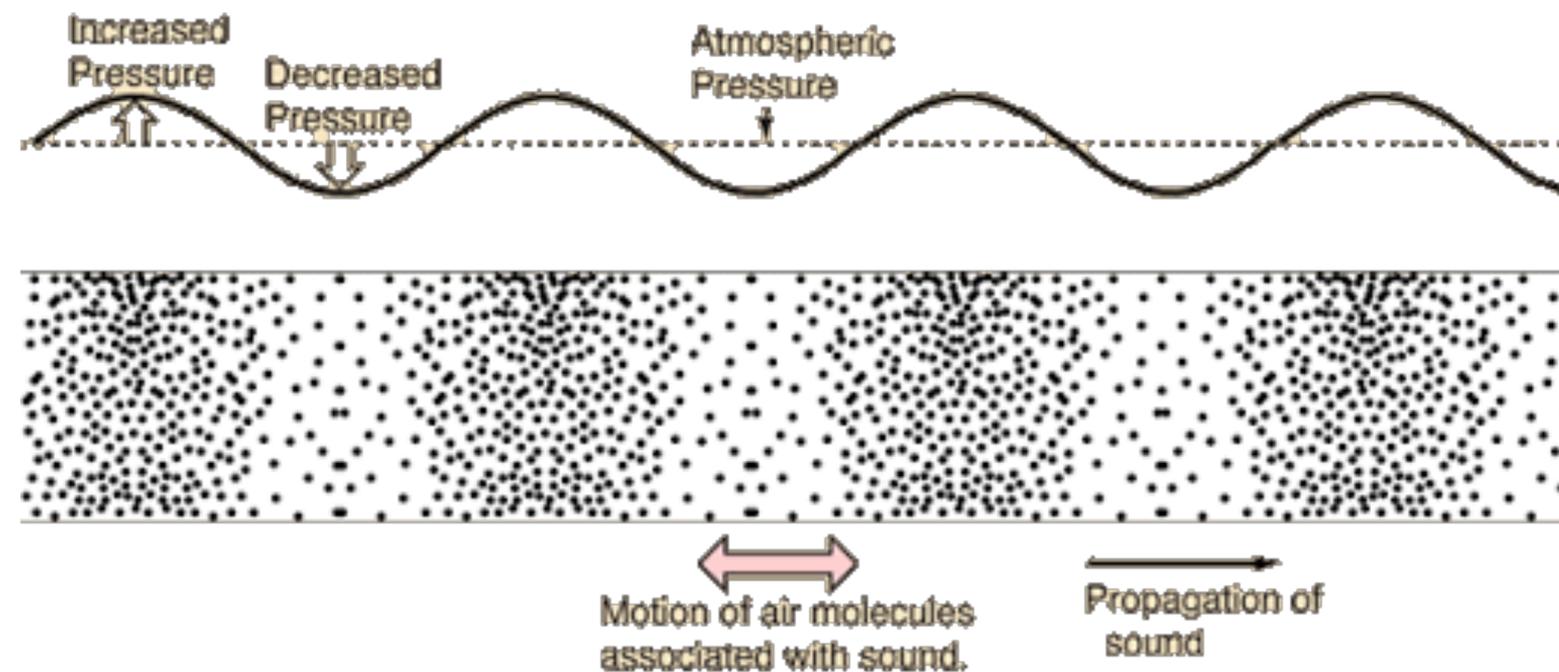

- $P' = P_0 e^{ik(x-c_w t)}$

- Plugging in this solution and solving for the constant c_w :

$$c_w = \bar{u} \pm \left(\frac{\gamma \bar{P}}{\bar{\rho}} \right)^{\frac{1}{2}} = \bar{u} \pm \sqrt{\gamma R_g T} = \bar{u} + c_s$$

- Where c_s is the speed of sound relative to the background flow:

$$c_s = \sqrt{\gamma R_g T}$$

Acoustic Waves

- Amplitude of sound wave is related to its intensity (W/m^2) by:

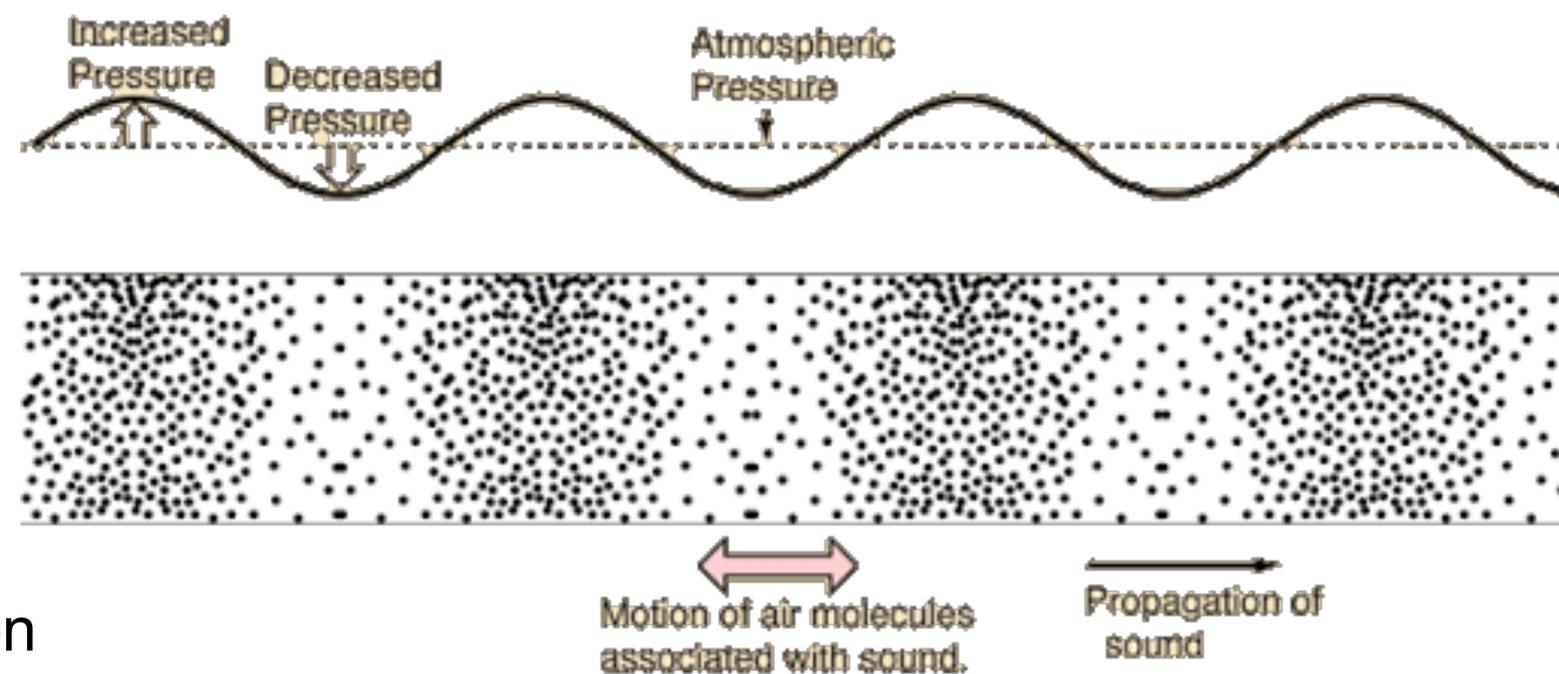

$$I_s = \frac{1}{2} \rho \omega^2 (\Delta l)^2 c_s = \frac{P_0^2}{2\rho c_s}$$

- Where:

$$\omega = 2\pi\nu = \text{angular frequency}$$

$$\rho = \text{air density}$$

$$\Delta l = \text{displacement of air particles due to pressure perturbation}$$

Acoustic Waves

- Amplitude of sound wave is related to its intensity (W/m^2) by:

$$I_s = \frac{1}{2} \rho \omega^2 (\Delta l)^2 c_s = \frac{P_0^2}{2\rho c_s}$$

- Pressure amplitude:

$$P_0 = (2I_s \rho c_s)^{\frac{1}{2}}$$

- Sound intensity:

$$L = 10 \log_{10} \left(\frac{I_s}{I_0} \right) \text{ dB}$$

“Standard Reference sound intensity”: $I_0 = 10^{-12} W/m^2$

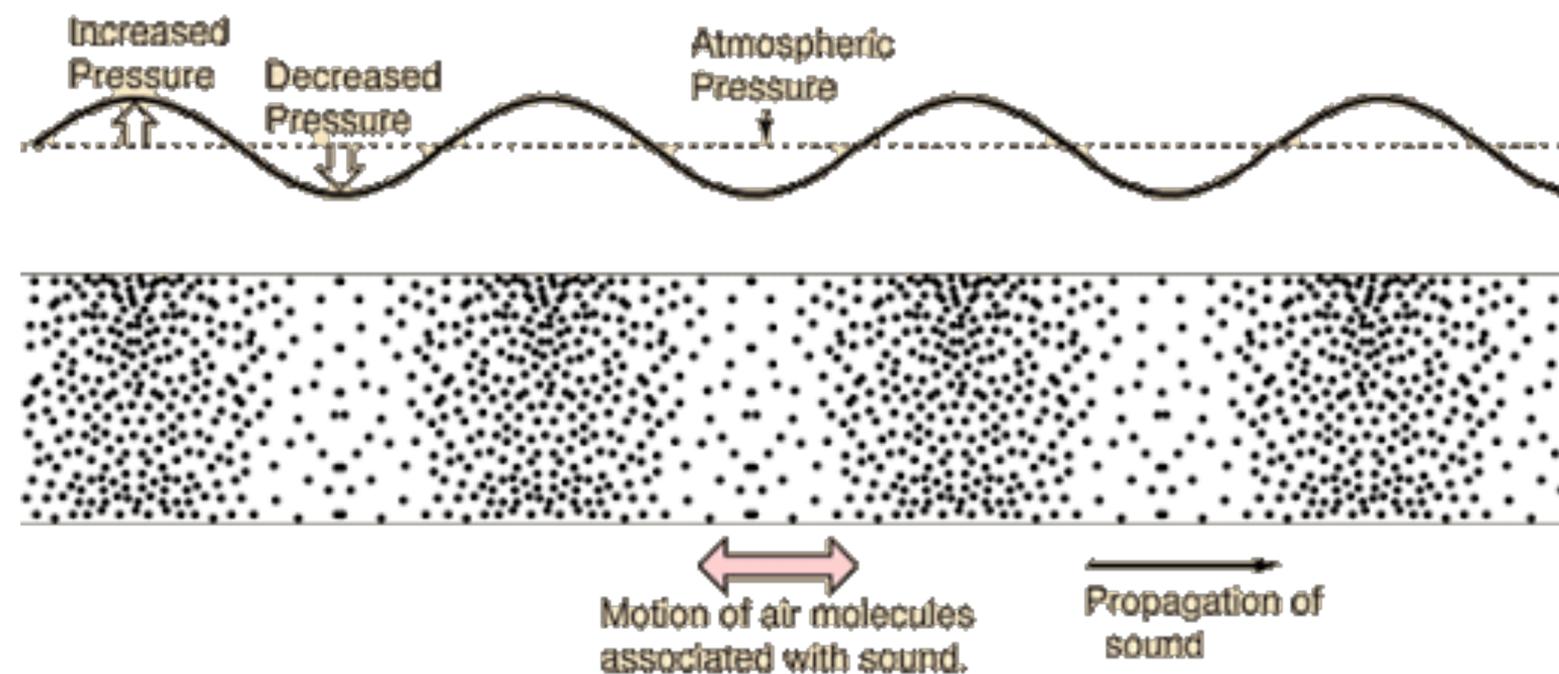

TABLE 8.1
Sound Speed in Planetary Atmospheres

Planet	Level	T (K)	P (Bar)	c_s (m s^{-1})
Venus	Surface	734	92	420
	$z=60$ km (clouds)	250	0.22	248
Earth	Surface	285	1	340
	$z=10$ km	217	0.1	295
Mars	Surface	240	0.007	229
	$z=80$ km	140	0.0001	185
Titan	Surface	94	1.5	194
	$z=28$ km	73	0.3	170
Jupiter	Ammonia cloud	127	0.4	815
	Water cloud	270	5	1200
Saturn	Ammonia cloud	107	0.5	763
Uranus	Methane cloud	85	1.4	655
Neptune	Methane cloud	81	1.4	640
HD 209458B	—	1350	0.5	2500

Order of Magnitude: Acoustic Waves

$$P_0 = (2I_s \rho c_s)^{\frac{1}{2}}$$

$$c_s = \sqrt{\gamma R_g T} = \sqrt{\frac{\gamma P}{\rho}}$$

$$1 \text{ bar} = 10^5 \text{ Pa}$$

$$\text{Monatomic: } \gamma = \frac{5}{3}$$

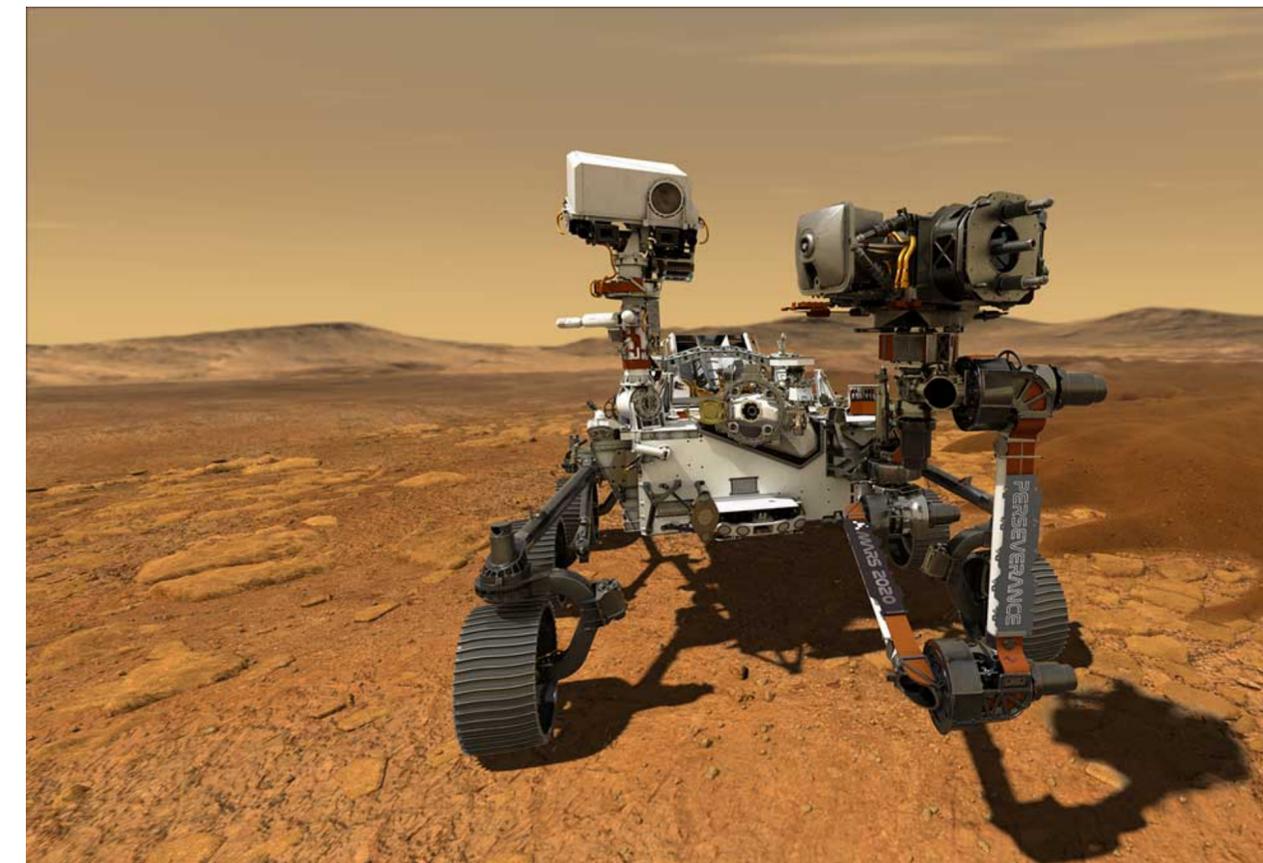

$$\text{Diatomic: } \gamma = \frac{7}{5}$$

$$\text{Polyatomic: } \gamma = \frac{4}{3}$$

$$L = 10 \log_{10} \left(\frac{I_s}{I_0} \right) \text{ dB}$$

$$I_0 = 10^{-12} \text{ W/m}^2$$

- (1) Thunder in Earth's atmosphere produces a sound wave with an intensity of 80 dB. What is the pressure amplitude considering the conditions at the surface?
- (2) Calculate the pressure amplitude of a sound wave in Mars' atmosphere corresponding to a sound level of 60 dB being detected by a microphone on a Martian probe.

Order of Magnitude: Acoustic Waves

$$P_0 = (2I_s \rho c_s)^{\frac{1}{2}} \quad c_s = \sqrt{\gamma R_g T} = \sqrt{\frac{\gamma P}{\rho}}$$

$$L = 10 \log_{10}\left(\frac{I_s}{I_0}\right) \text{ dB}$$

$$1 \text{ bar} = 10^5 \text{ Pa}$$

$$\text{Monatomic: } \gamma = \frac{5}{3}$$

$$\text{Diatomic: } \gamma = \frac{7}{5}$$

$$I_0 = 10^{-12} \text{ W/m}^2 \quad \text{Polyatomic: } \gamma = \frac{4}{3}$$

- (1) Thunder in Earth's atmosphere produces a sound wave with an intensity of 80 dB. What is the pressure amplitude considering the conditions at the surface?

- Ok, let's first solve the second equation for the intensity:

$$\log_{10}\left(\frac{I_s}{I_0}\right) = \frac{L}{10} \quad I_s = I_0 10^{L/10}$$

- Then we plug that into the pressure amplitude equation:

$$P_0 = (2I_0 10^{L/10} \rho c_s)^{\frac{1}{2}}$$

Order of Magnitude: Acoustic Waves

- $P_0 = (2I_0 10^{L/10} \rho c_s)^{\frac{1}{2}}$

- Almost done, now we also need to replace density with something we have, pressure and sound speed:

$$c_s = \sqrt{\gamma R_g T} = \sqrt{\frac{\gamma P}{\rho}} \quad \text{Solving for density:} \quad \rho = \frac{\gamma P}{c_s^2}$$

- Plugging in: $P_0 = \sqrt{\frac{2I_0 10^{L/10} \gamma P}{c_s}}$ Great, we can use this equation for both problems.

- On Earth's surface, P is 1 bar (cgs units) = 10^5 Pa (mks units), and speed of sound is 340 m/s (mks)

- The atmosphere is mainly molecular nitrogen and molecular oxygen, both diatomic, so $\gamma = \frac{7}{5}$

- Finally, the problem asks us to solve for 80 dB, and the constant $I_0 = 10^{-12} \text{ W/m}^2$

Order of Magnitude: Acoustic Waves

$$P_0 = \sqrt{\frac{2I_0 10^{L/10} \gamma P}{c_s}} = \sqrt{\frac{2(10^{-12} \text{W/m}^2) 10^{(80)/10} (7/5) (10^5 \text{Pa})}{(340 \text{m/s})}} = \sqrt{\frac{3 \times 10^{-12+8+5}}{3 \times 10^2}} = \sqrt{10^{-1}} = \frac{1}{3} \text{Pa}$$

• (2) Calculate the pressure amplitude of a sound wave in Mars' atmosphere corresponding to a sound level of 60 dB being detected by a microphone on a Martian probe.

• On Mars' surface, P is 0.007 bar (cgs units) = 700 Pa (mks units), and speed of sound is 229 m/s (mks)

• The atmosphere is mainly carbon dioxide, polyatomic, so $\gamma = \frac{4}{3}$

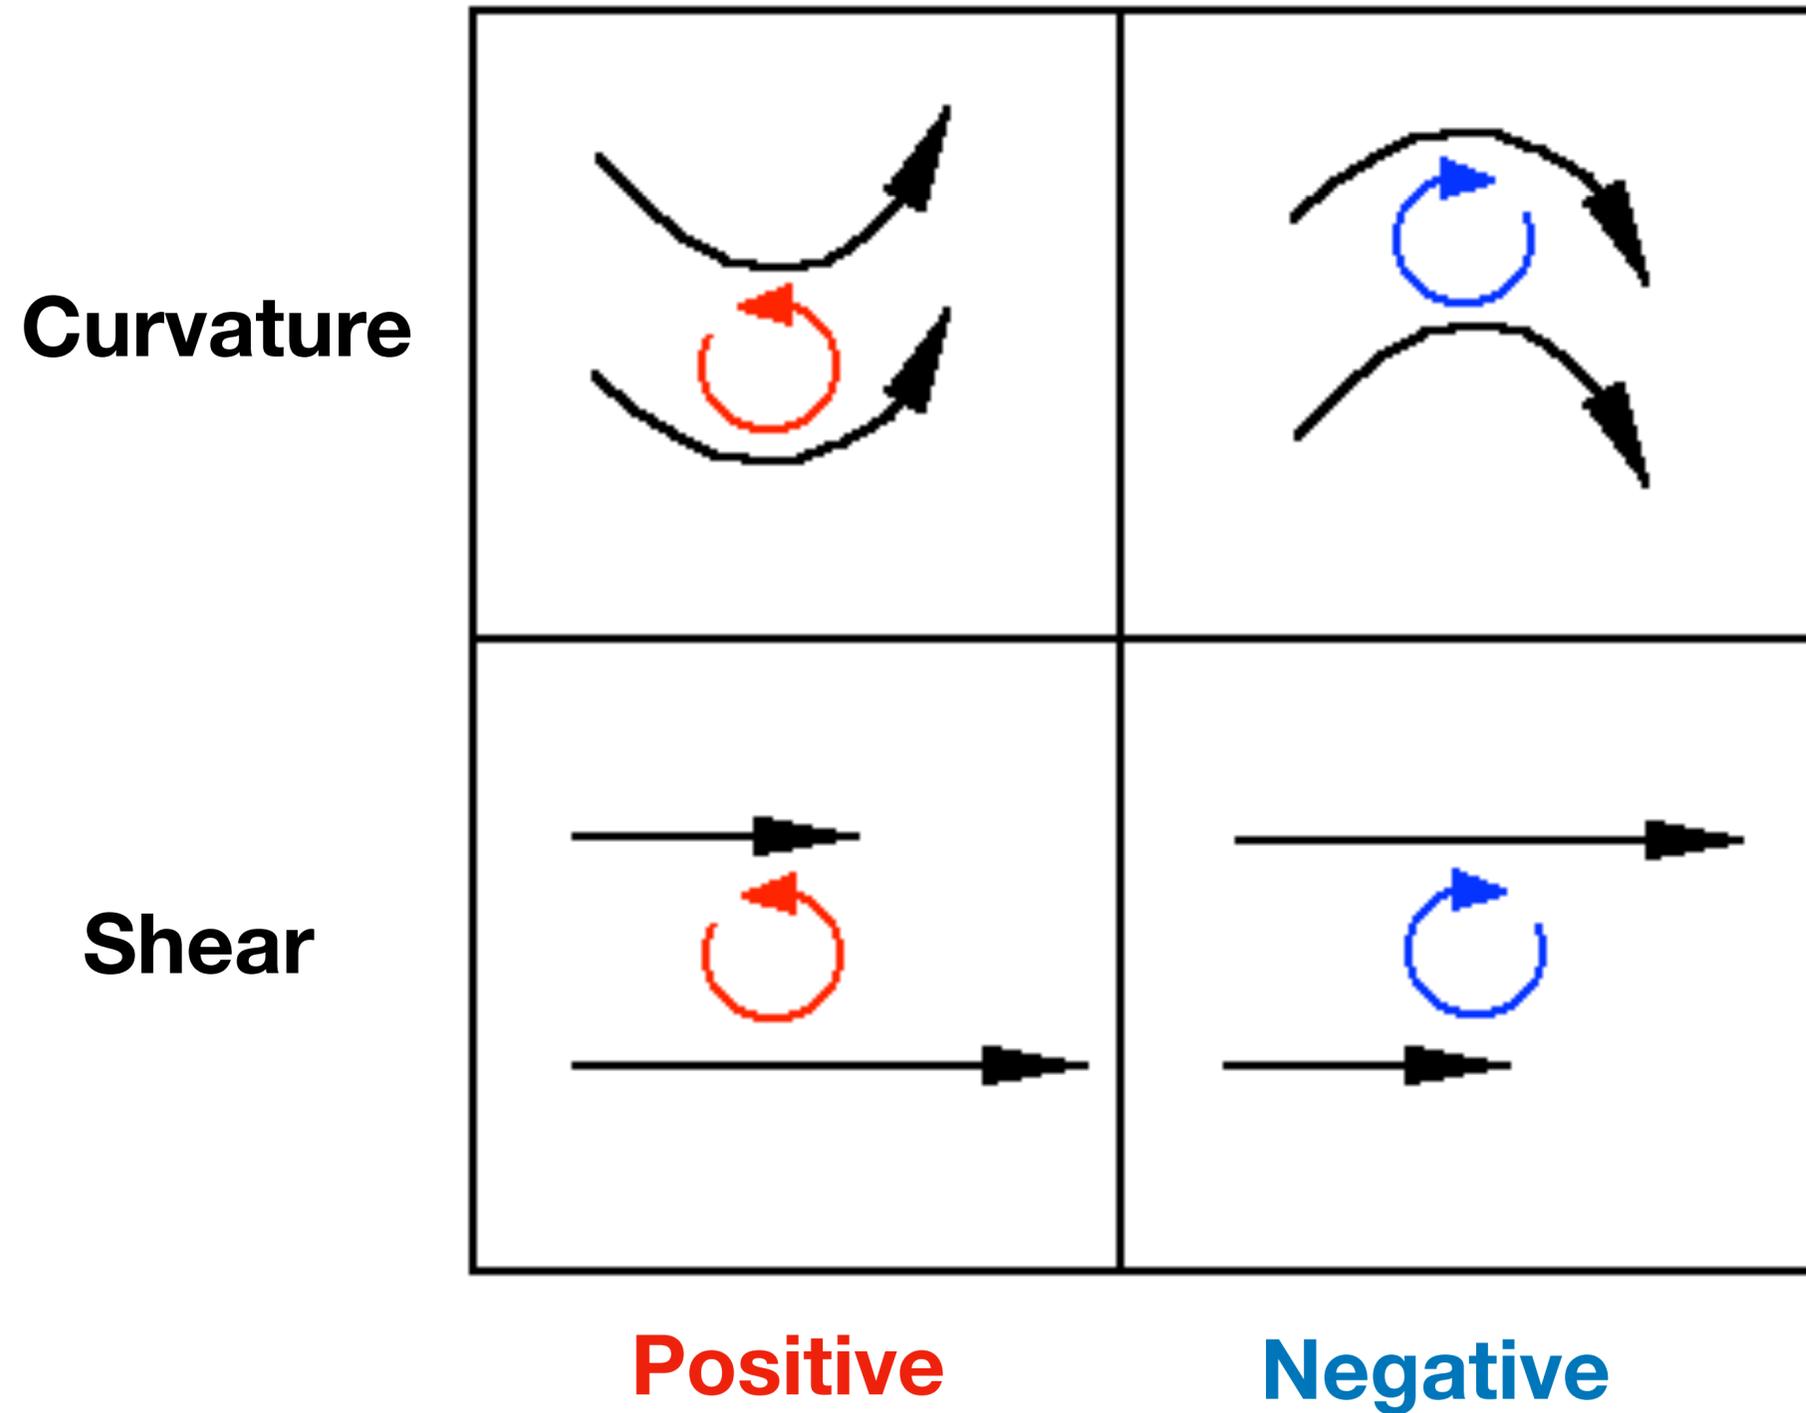

$$P_0 = \sqrt{\frac{2(10^{-12} \text{W/m}^2) 10^{(60)/10} (4/3) (700 \text{Pa})}{(229 \text{m/s})}} = \sqrt{\frac{2 \times 4 \times 7 \times 10^{-12+6+2}}{2 \times 3 \times 10^2}} = \sqrt{9 \times 10^{-6}} = 3 \times 10^{-3} \text{Pa}$$

Measurements of Rotation

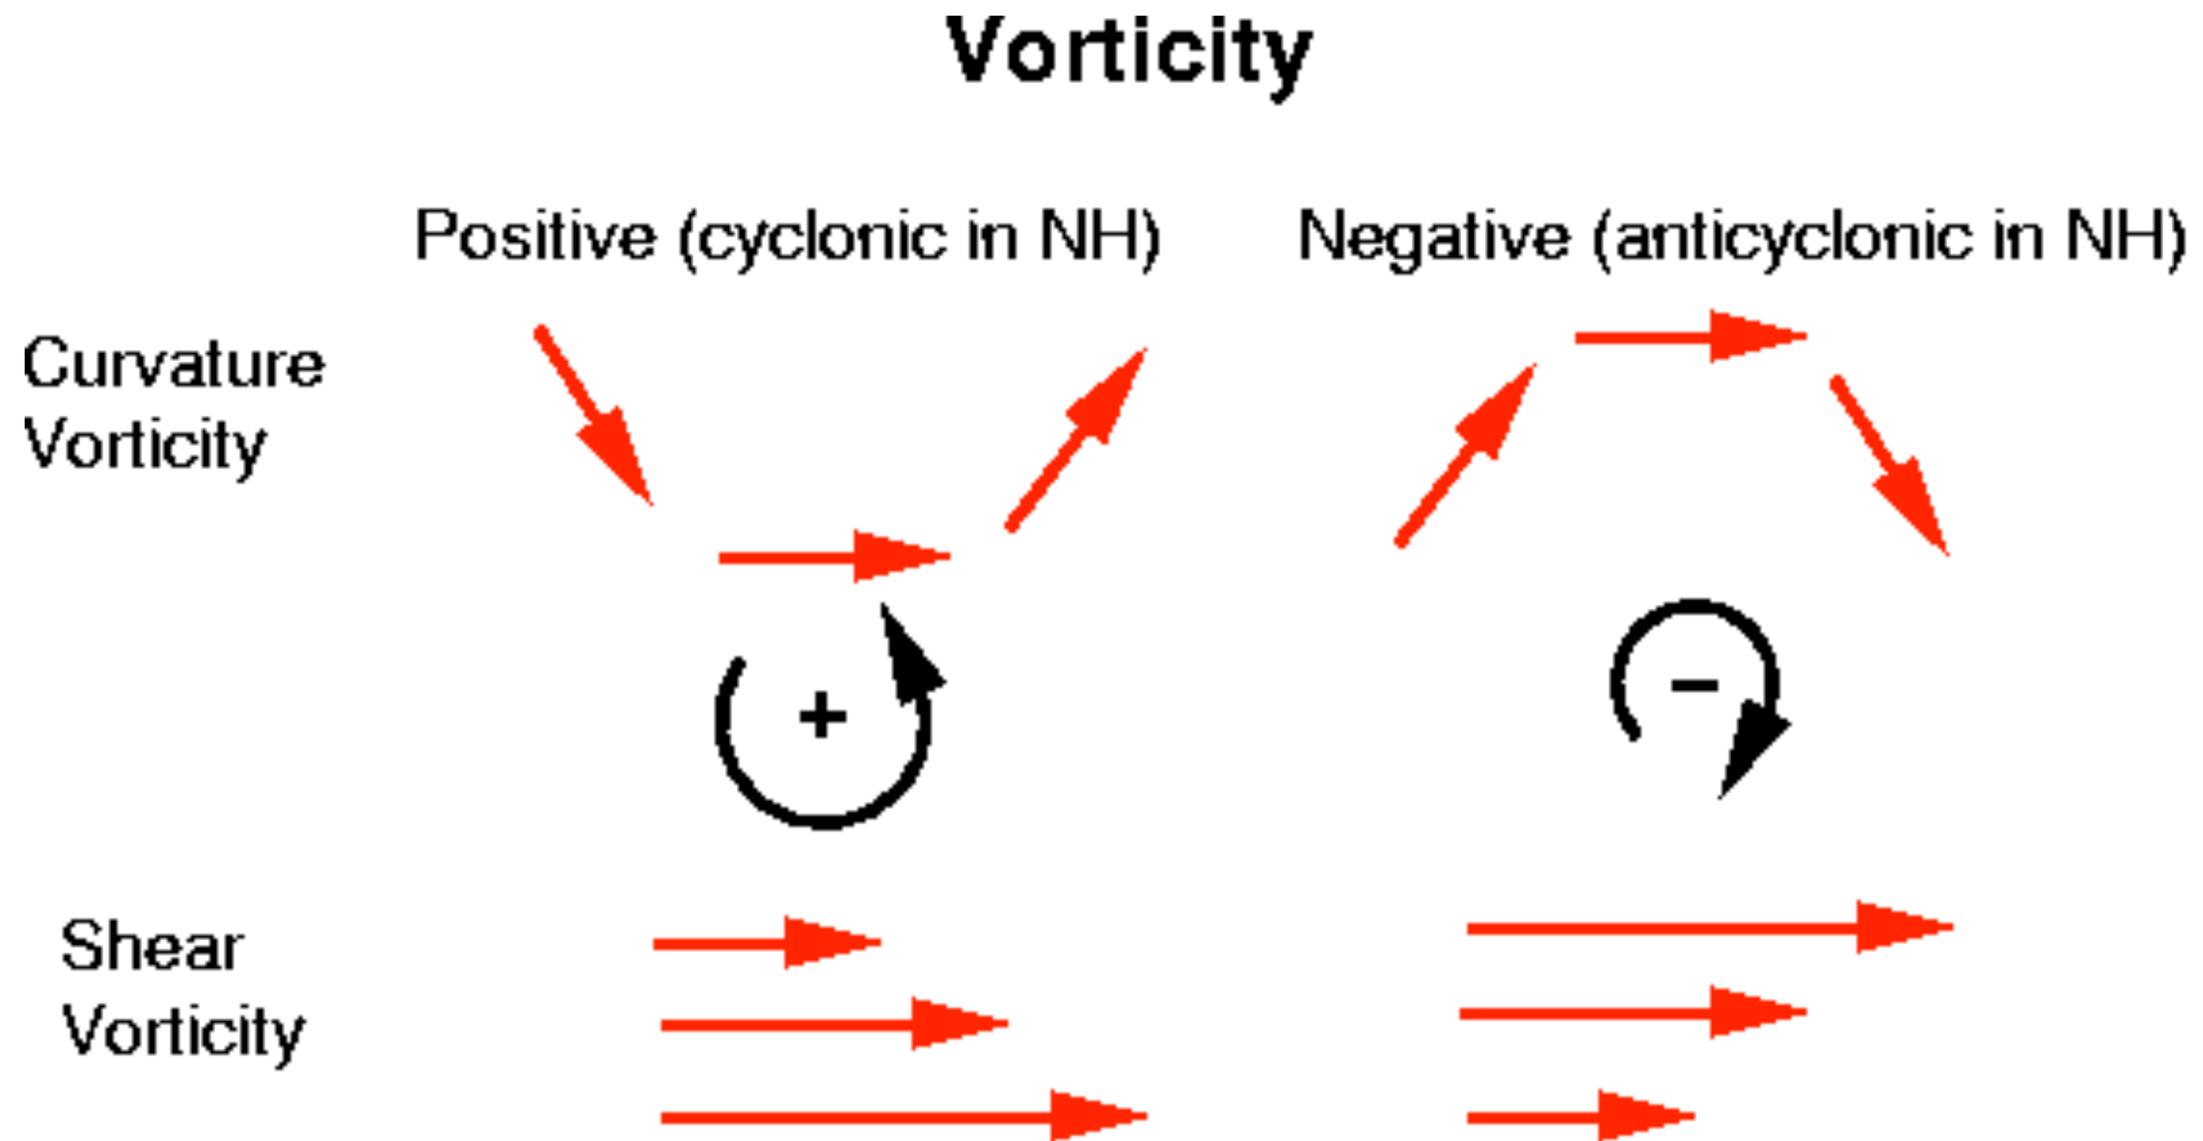

- Circulation: a scalar integral quantity, macroscopic measure of rotation for a finite area of the fluid
- Vorticity: a vector field, is a microscopic measure of the rotation at any point in the fluid
- The concepts of circulation, vorticity, and potential vorticity play a key role in atmospheric dynamics and meteorology
 - They characterize the rotational state of a fluid

Vorticity

Vorticity

Vorticity

- Defined as the curl of the velocity vector

- Measures local rotation of fluid (s^{-1})

- $$\vec{\omega} = \vec{\nabla} \times \vec{u} = \left(\frac{\partial w}{\partial y} - \frac{\partial v}{\partial z}, \frac{\partial u}{\partial z} - \frac{\partial w}{\partial x}, \frac{\partial v}{\partial x} - \frac{\partial u}{\partial y} \right)$$

- For 2D flow in (x,y) plane, vorticity only has a z-component

- $$\vec{\omega} = \omega(0,0,\xi)$$

$$\xi = \frac{\partial v}{\partial x} - \frac{\partial u}{\partial y}$$

This measures the “spin” of the flow

For next time

- Homework 4 due tonight at 11:59pm
- Reading: Planetary Science, 4.5.3, 4.5.4.6
